

Artificial Intelligence is over 40 years old. It has resulted in some smart computation but has revealed very little about the operation of the brain. In recent years AI researchers have attempted to put this right and have specifically concentrated on modelling the brain to try to reveal what mechanisms are essential for human and animal consciousness. In our own work we have discovered that several mechanisms are involved in making us conscious. These computational mechanisms create a 'self' in a perceived world, ensure internal states as a basis for imagination, attend to important features of our world, plan and exhibit life-preserving emotions. This leads to a clarification of many issues surrounding consciousness. Are animals conscious? What is the unconscious? What is free will? Because emotions are present in these computational models, it may well be that a machine will be built that enjoys Christmas.

Cynthia Brezeal & Kismet - MIT

Why do we find it so hard to think of a machine as being conscious?

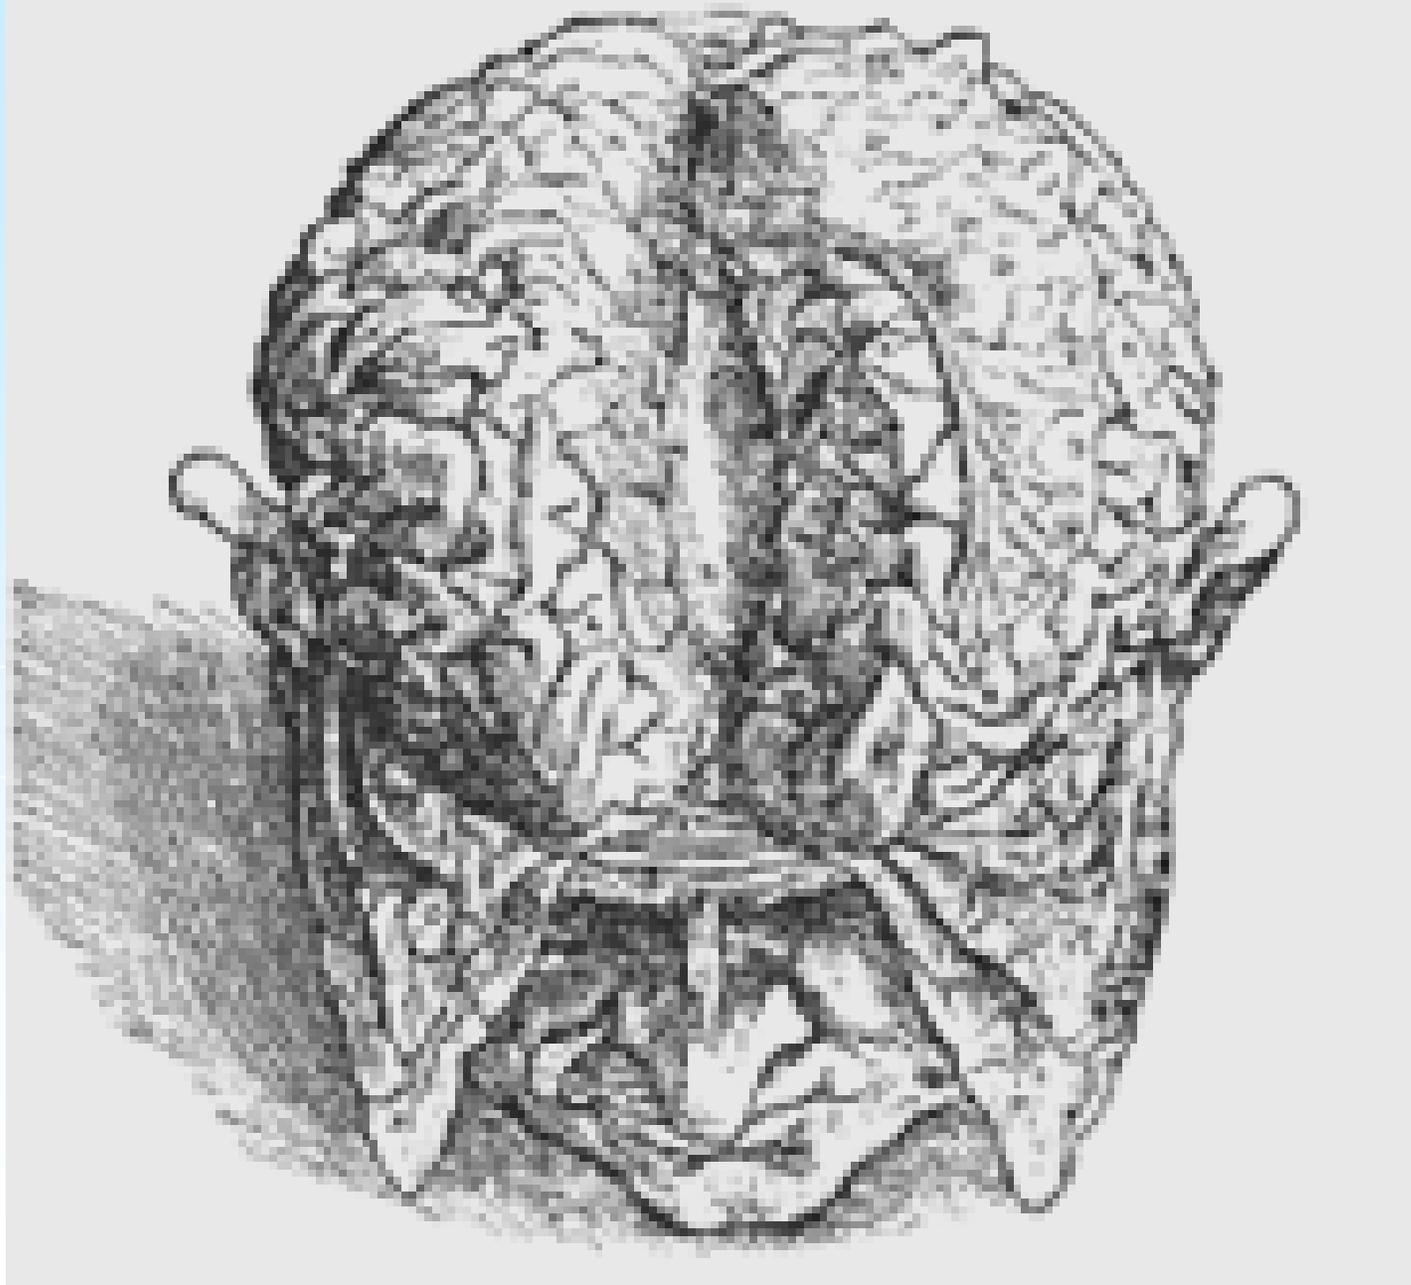

1. We are only SURE of our own consciousness.
2. We attribute it to other humans or optionally to other animals. Plants ...?
3. We are not sure what consciousness is, let alone how to instil it into a machine.

Sir Francis Crick
1916 - 2004

Crick's 'Astonishing Hypothesis' *Paraphrased*

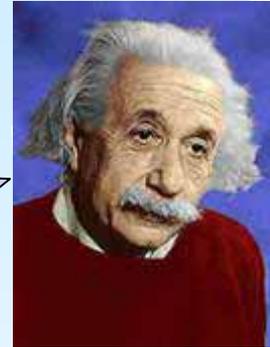

"All our joys, sorrows, loves, hates, appreciation of the world, literature and good wine are a function of the two fistfuls of porridge we call our brain ."

Vesalius 1542

Communicating neurons: memory and imagination

Let's try to design a
conscious machine!

(the constructive
approach)

DEFINITION ?

No definition

Try introspection ...

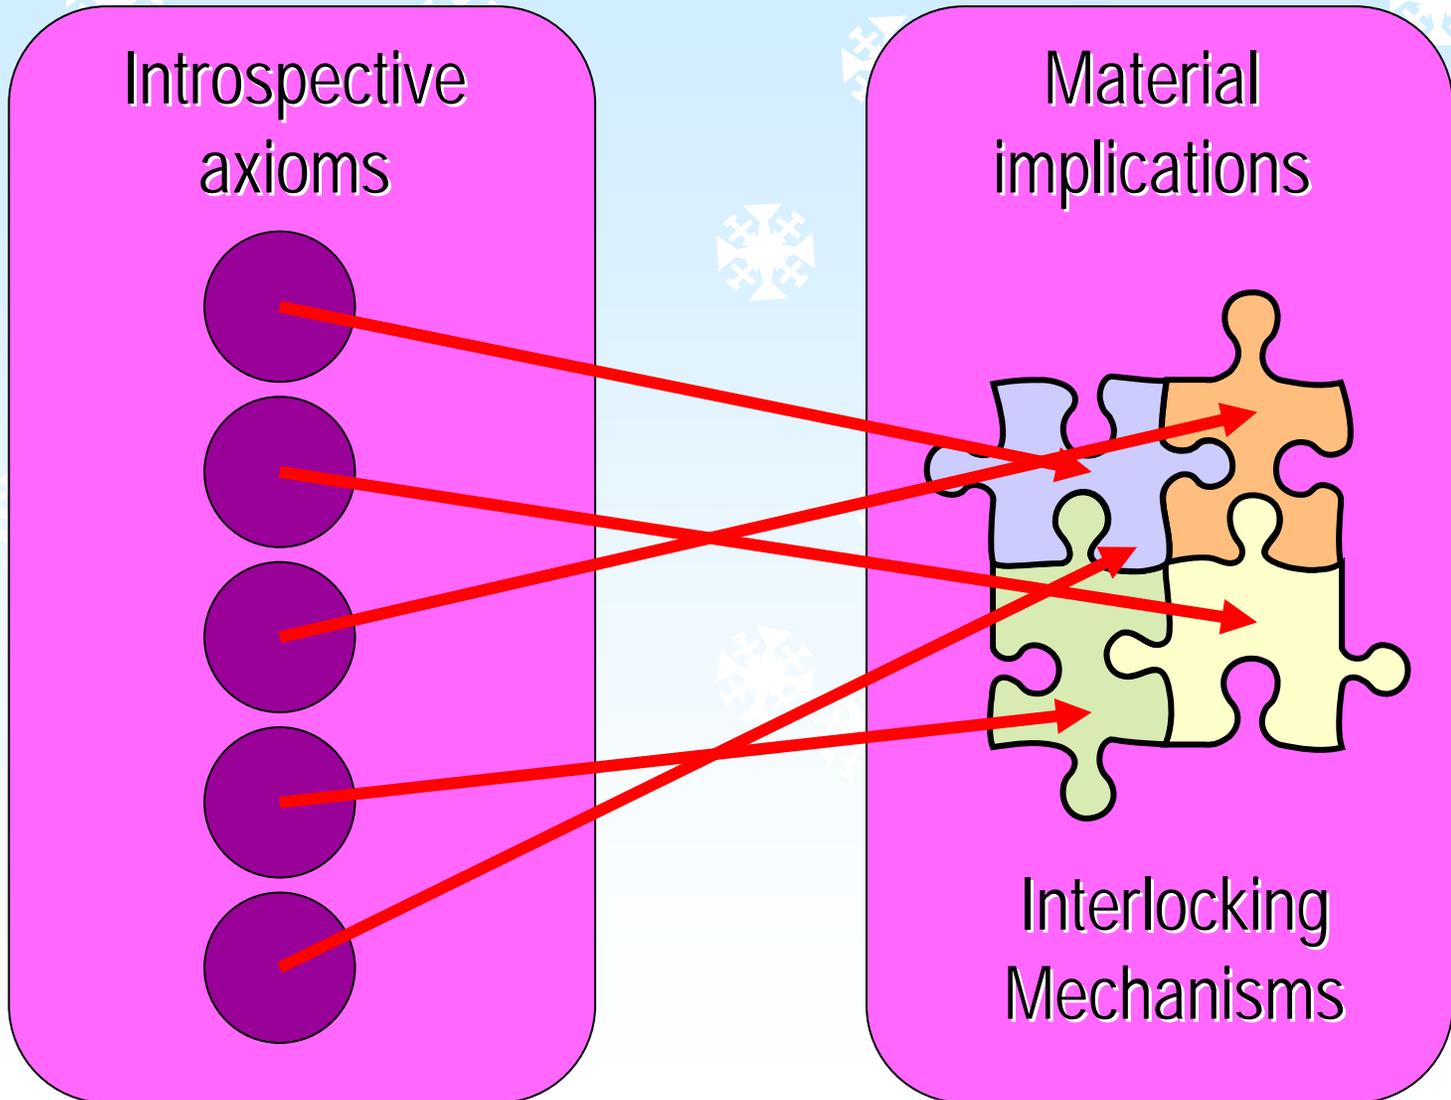

tells us that consciousness is lots of things.

We'll see five (called axioms).

What Axioms? (5 distinct ways in which I feel conscious)

1. PRESENCE: I feel in the middle of an out-there world.
2. IMAGINATION: I can imagine worlds I have and have not perceived.
3. ATTENTION: I focus on what is important to me
4. VOLITION: I can decide what to do next
5. EMOTION: I evaluate options open to me.

WHAT USE ARE INTROSPECTIVE AXIOMS?

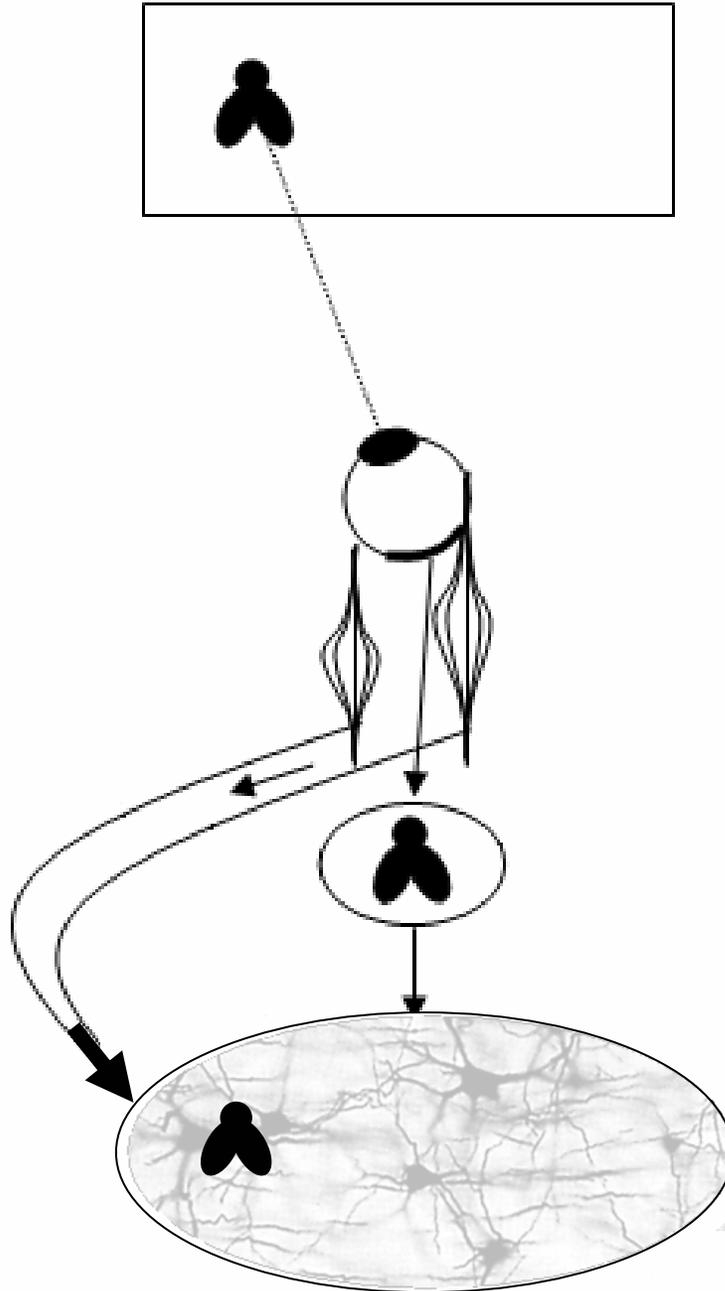

What is a DEPICTION?

A representation of where things are in the world

What Creates Presence?

Adapted from D. S. Green, Fundamentals of Veterinary Ophthalmology, 1998, Placemedia, 108.

What Creates Presence?

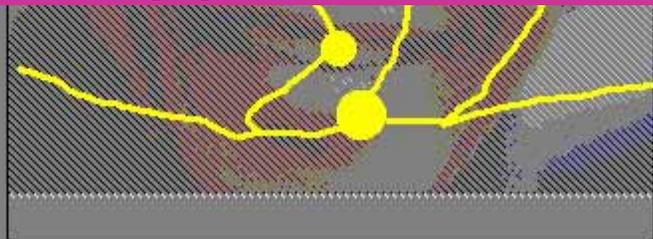

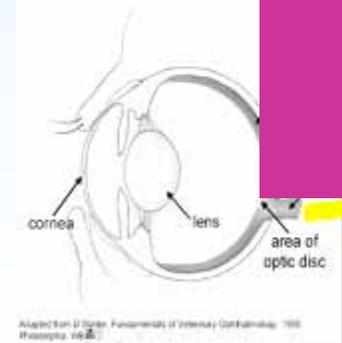

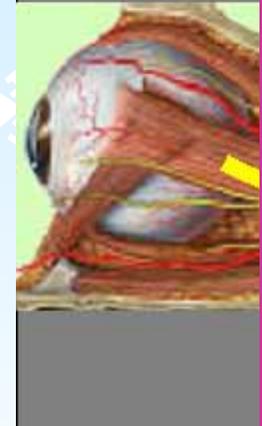

Answer:

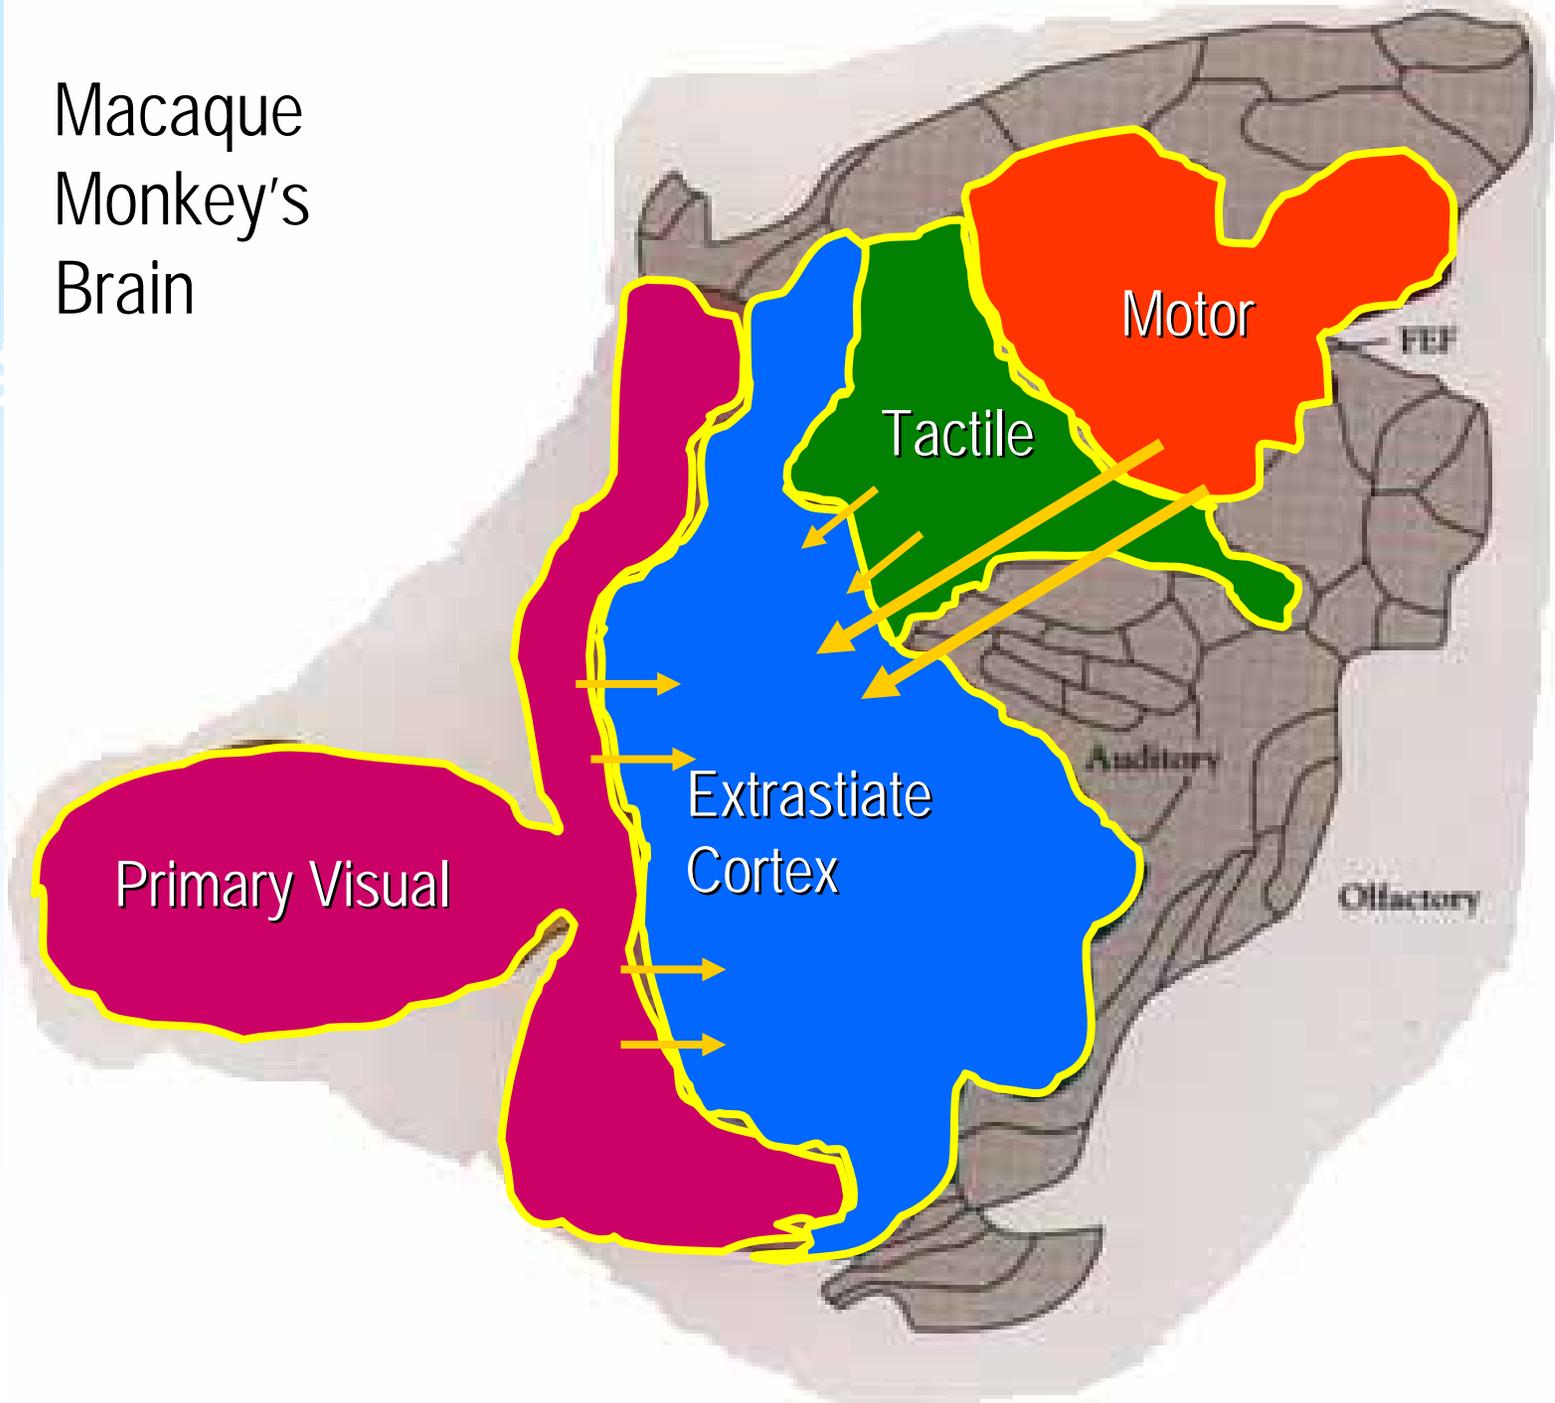

Presence in an out-there world is due to the influence of motor actions on sensory neural representations.

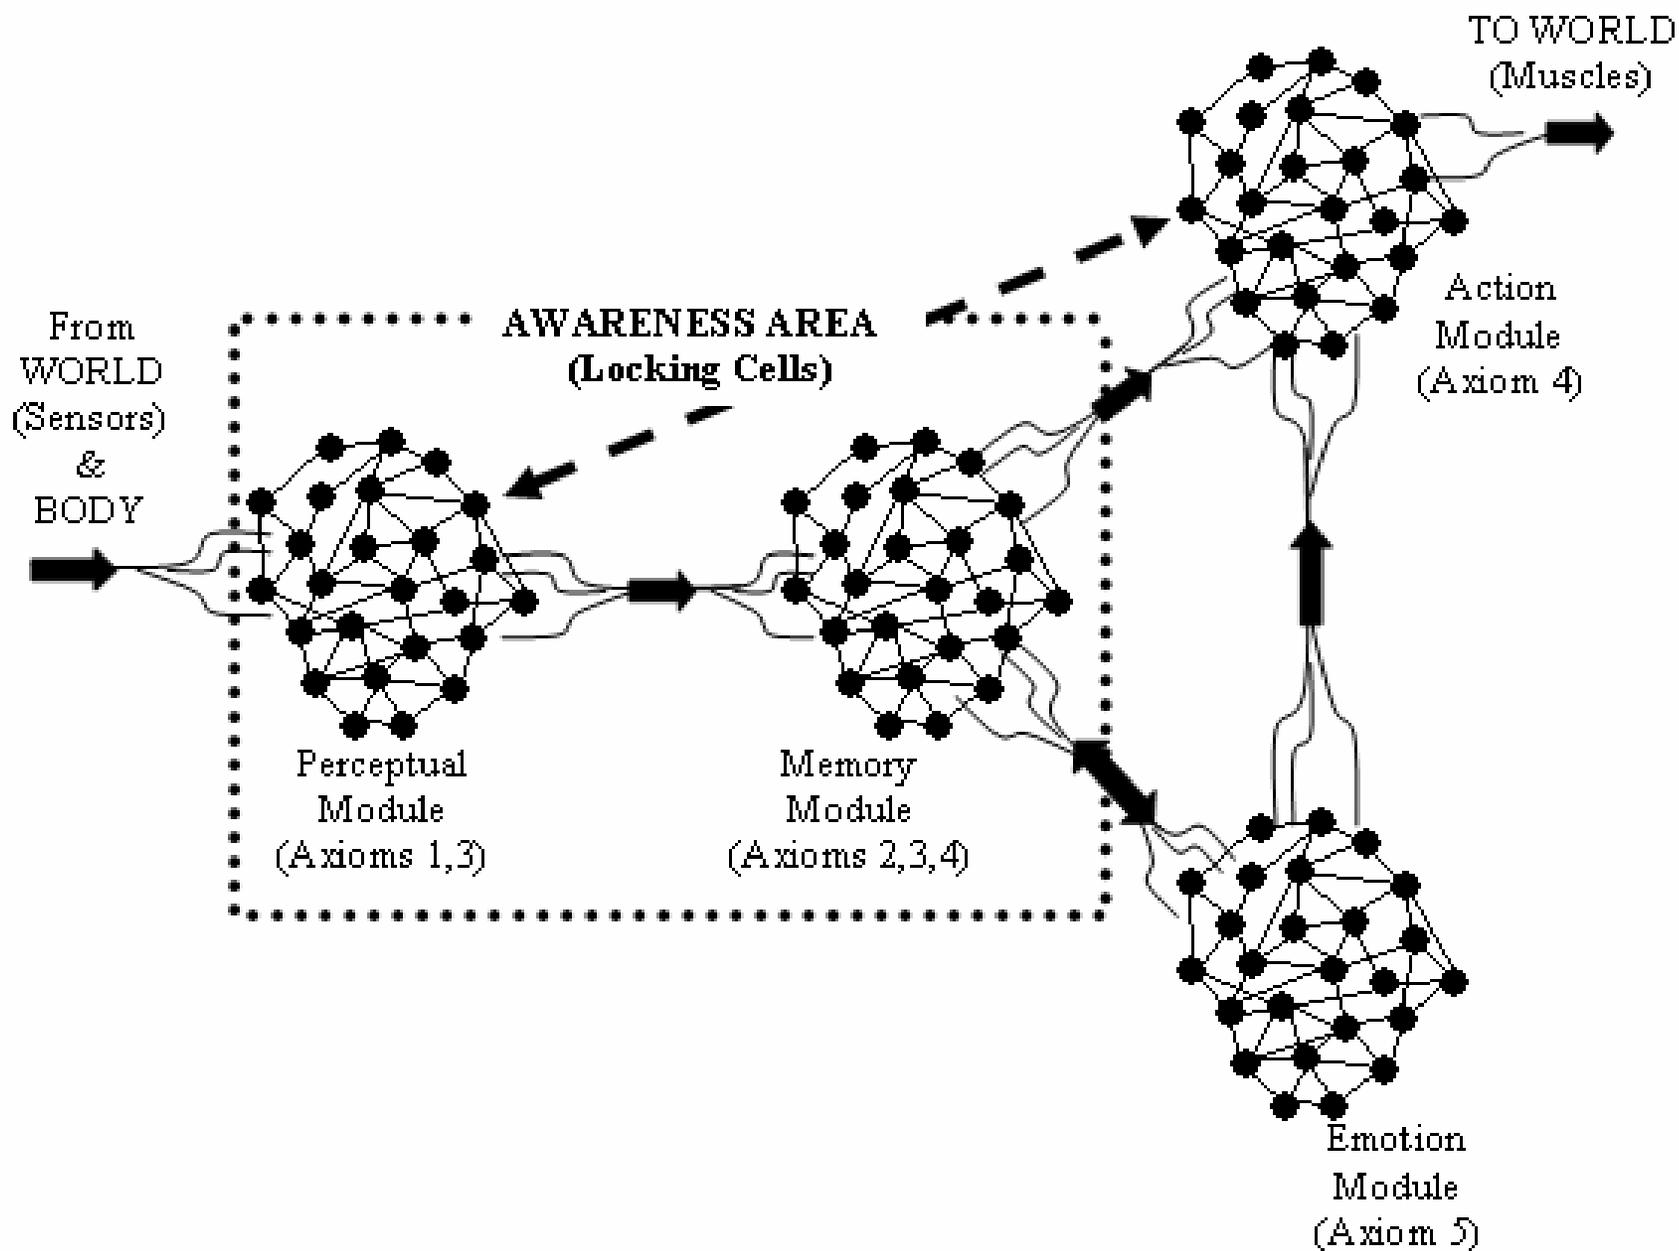

Does it happen in the brain?

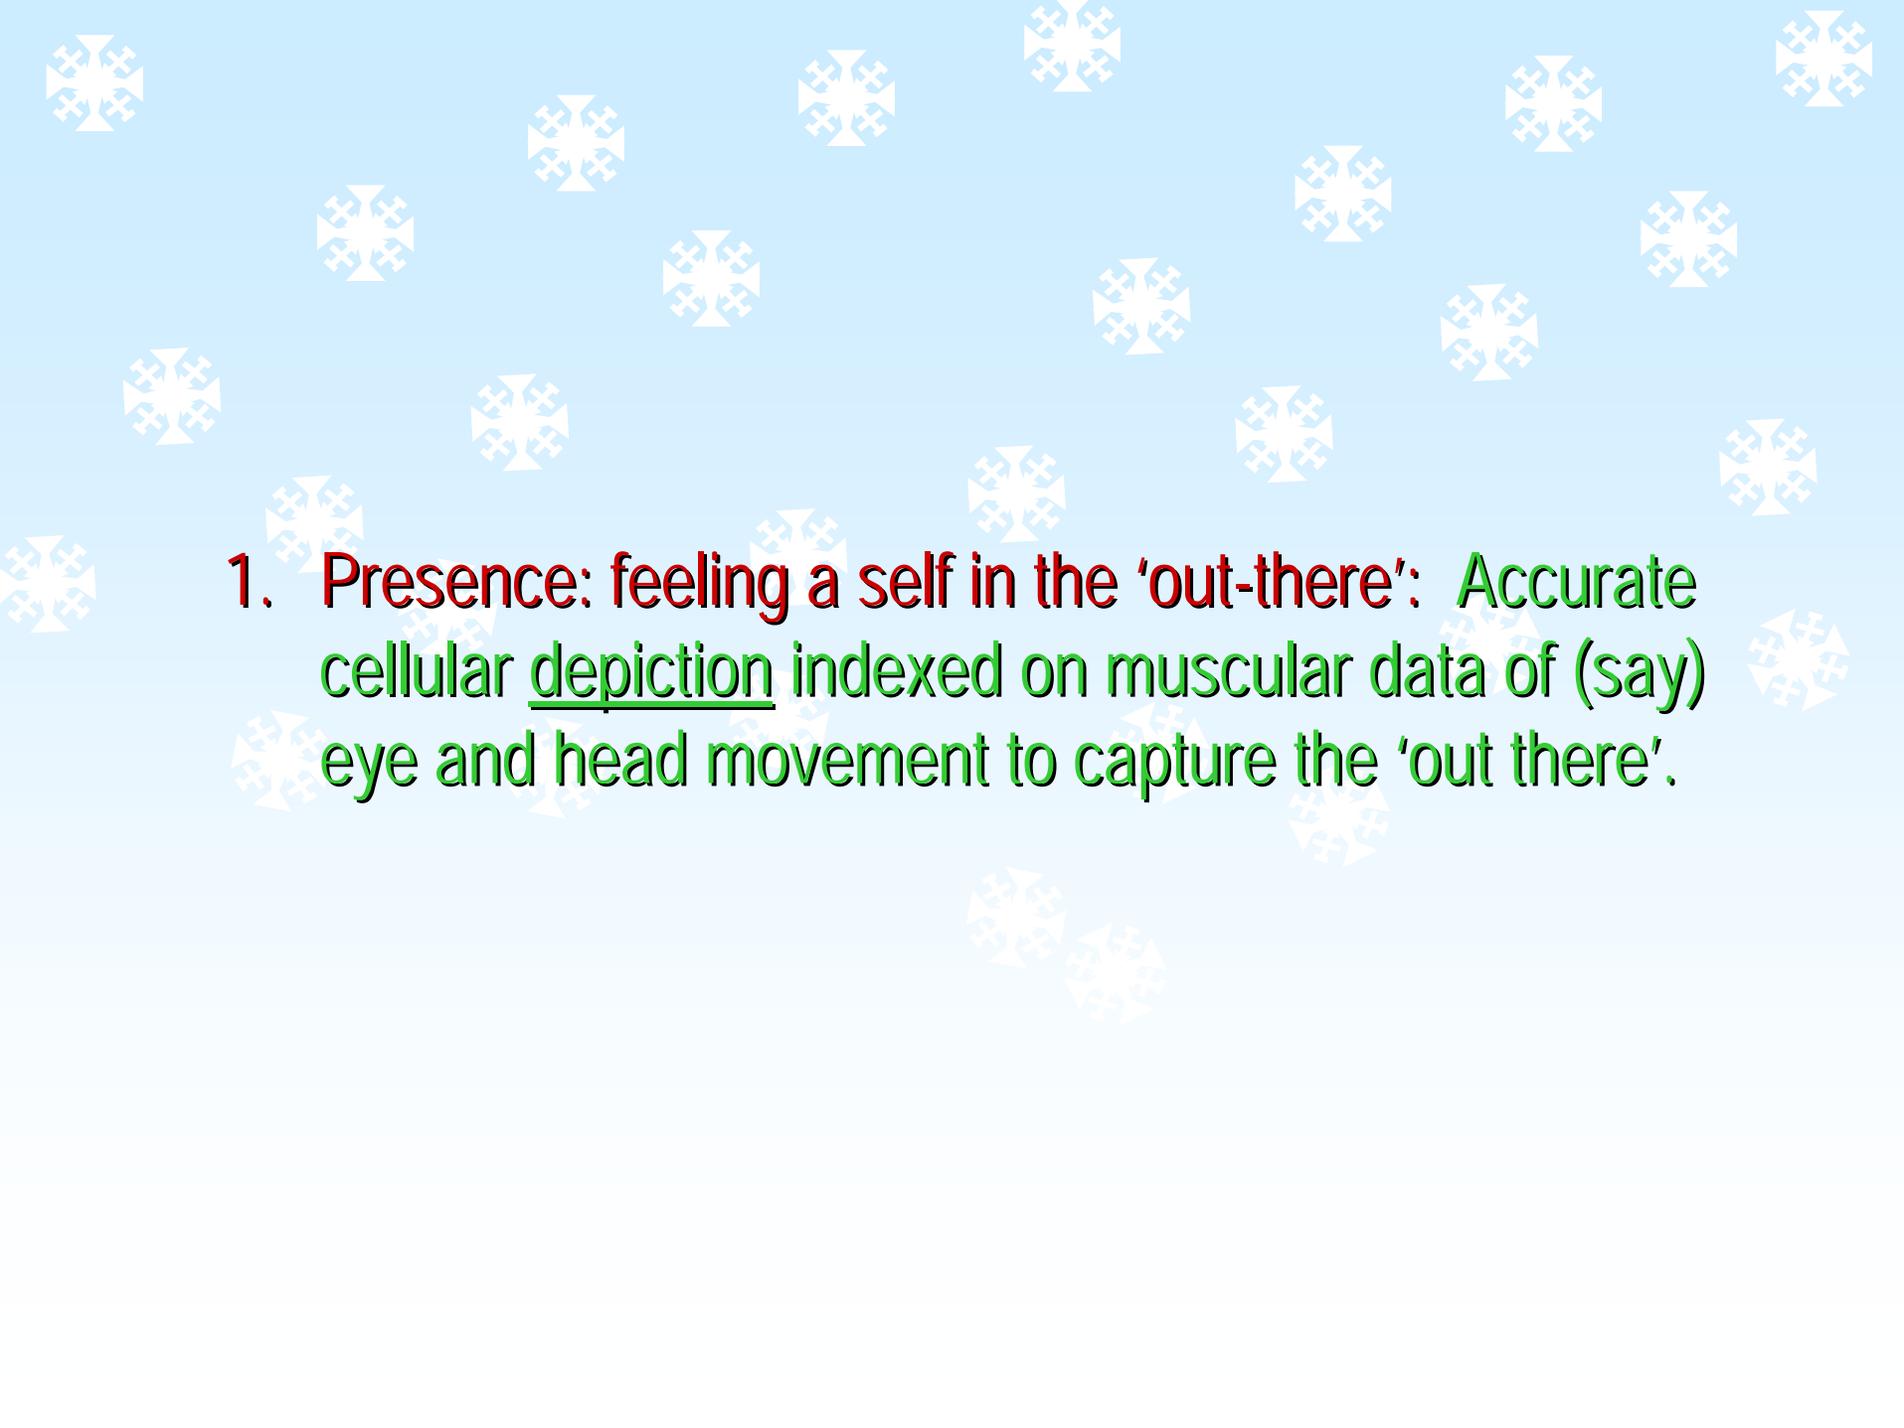

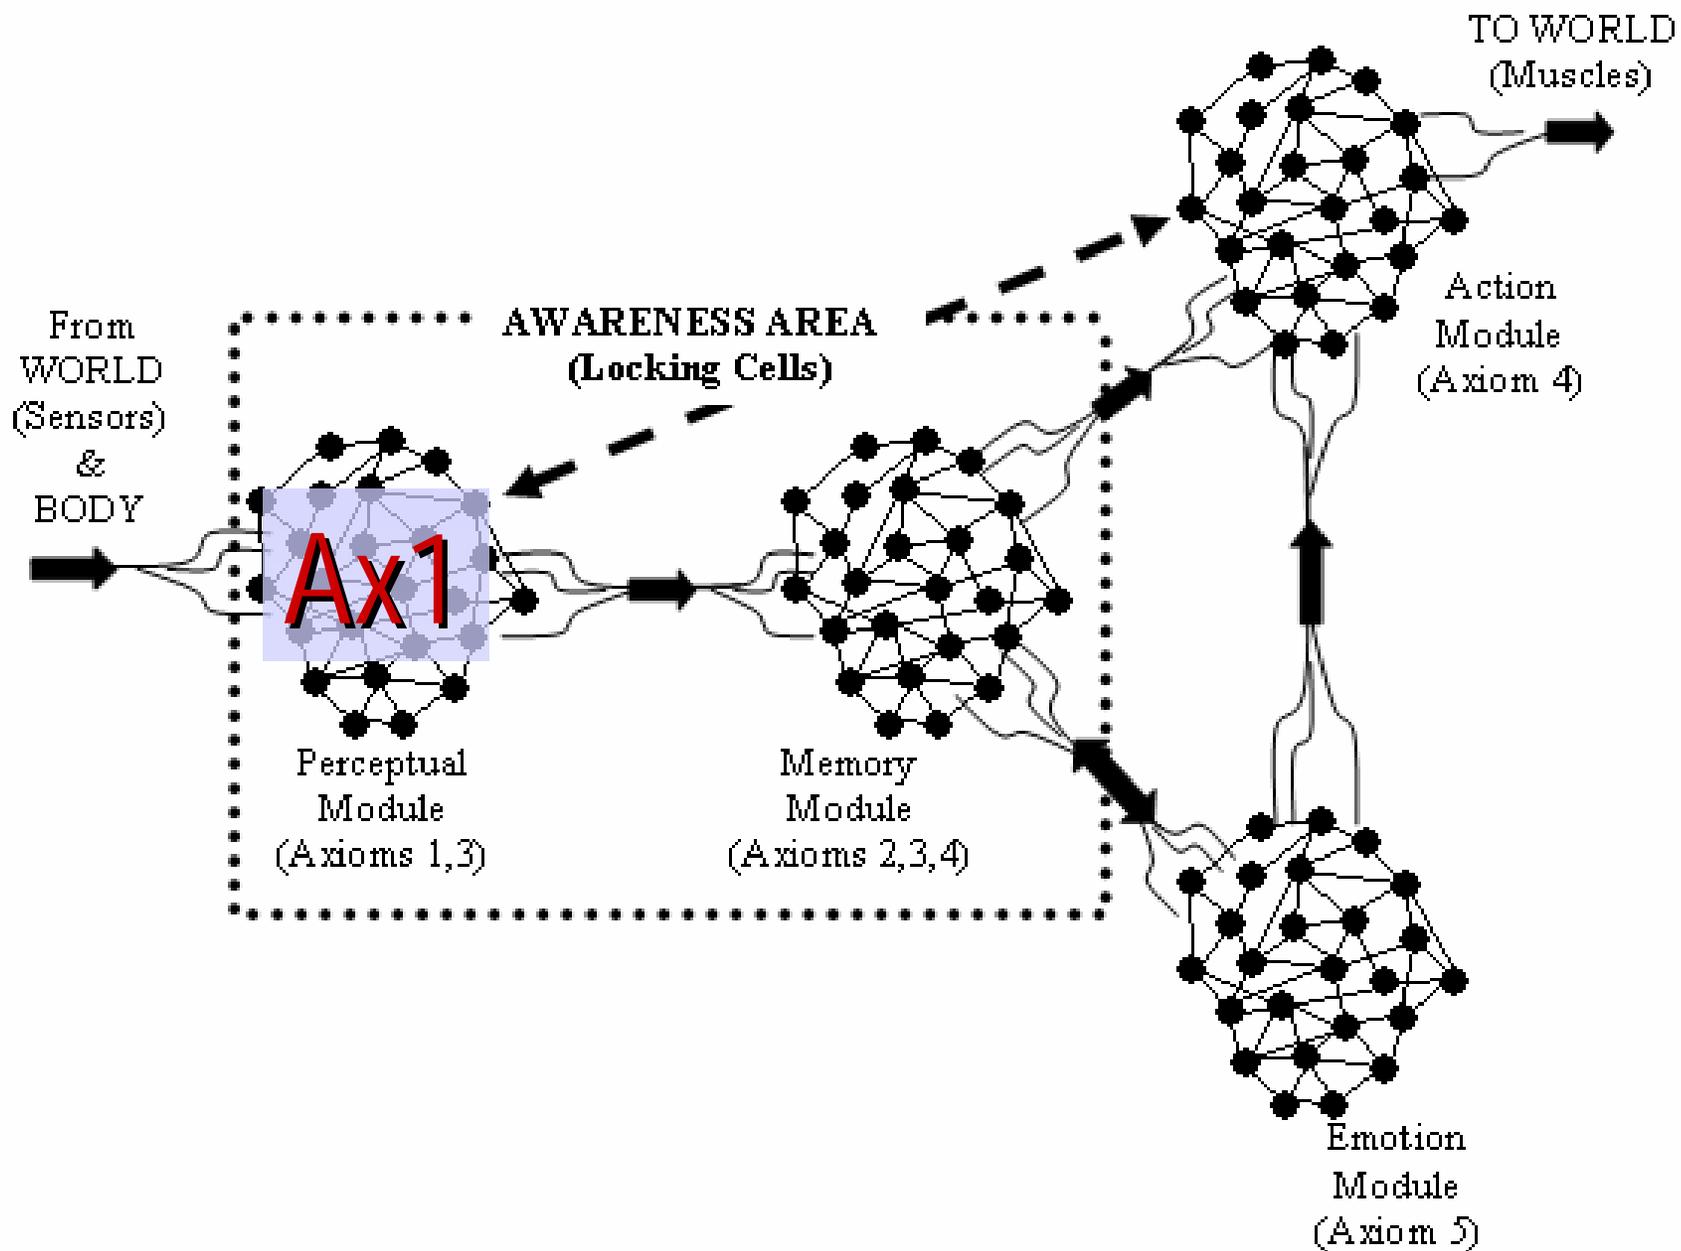

Macaque Monkey's Brain

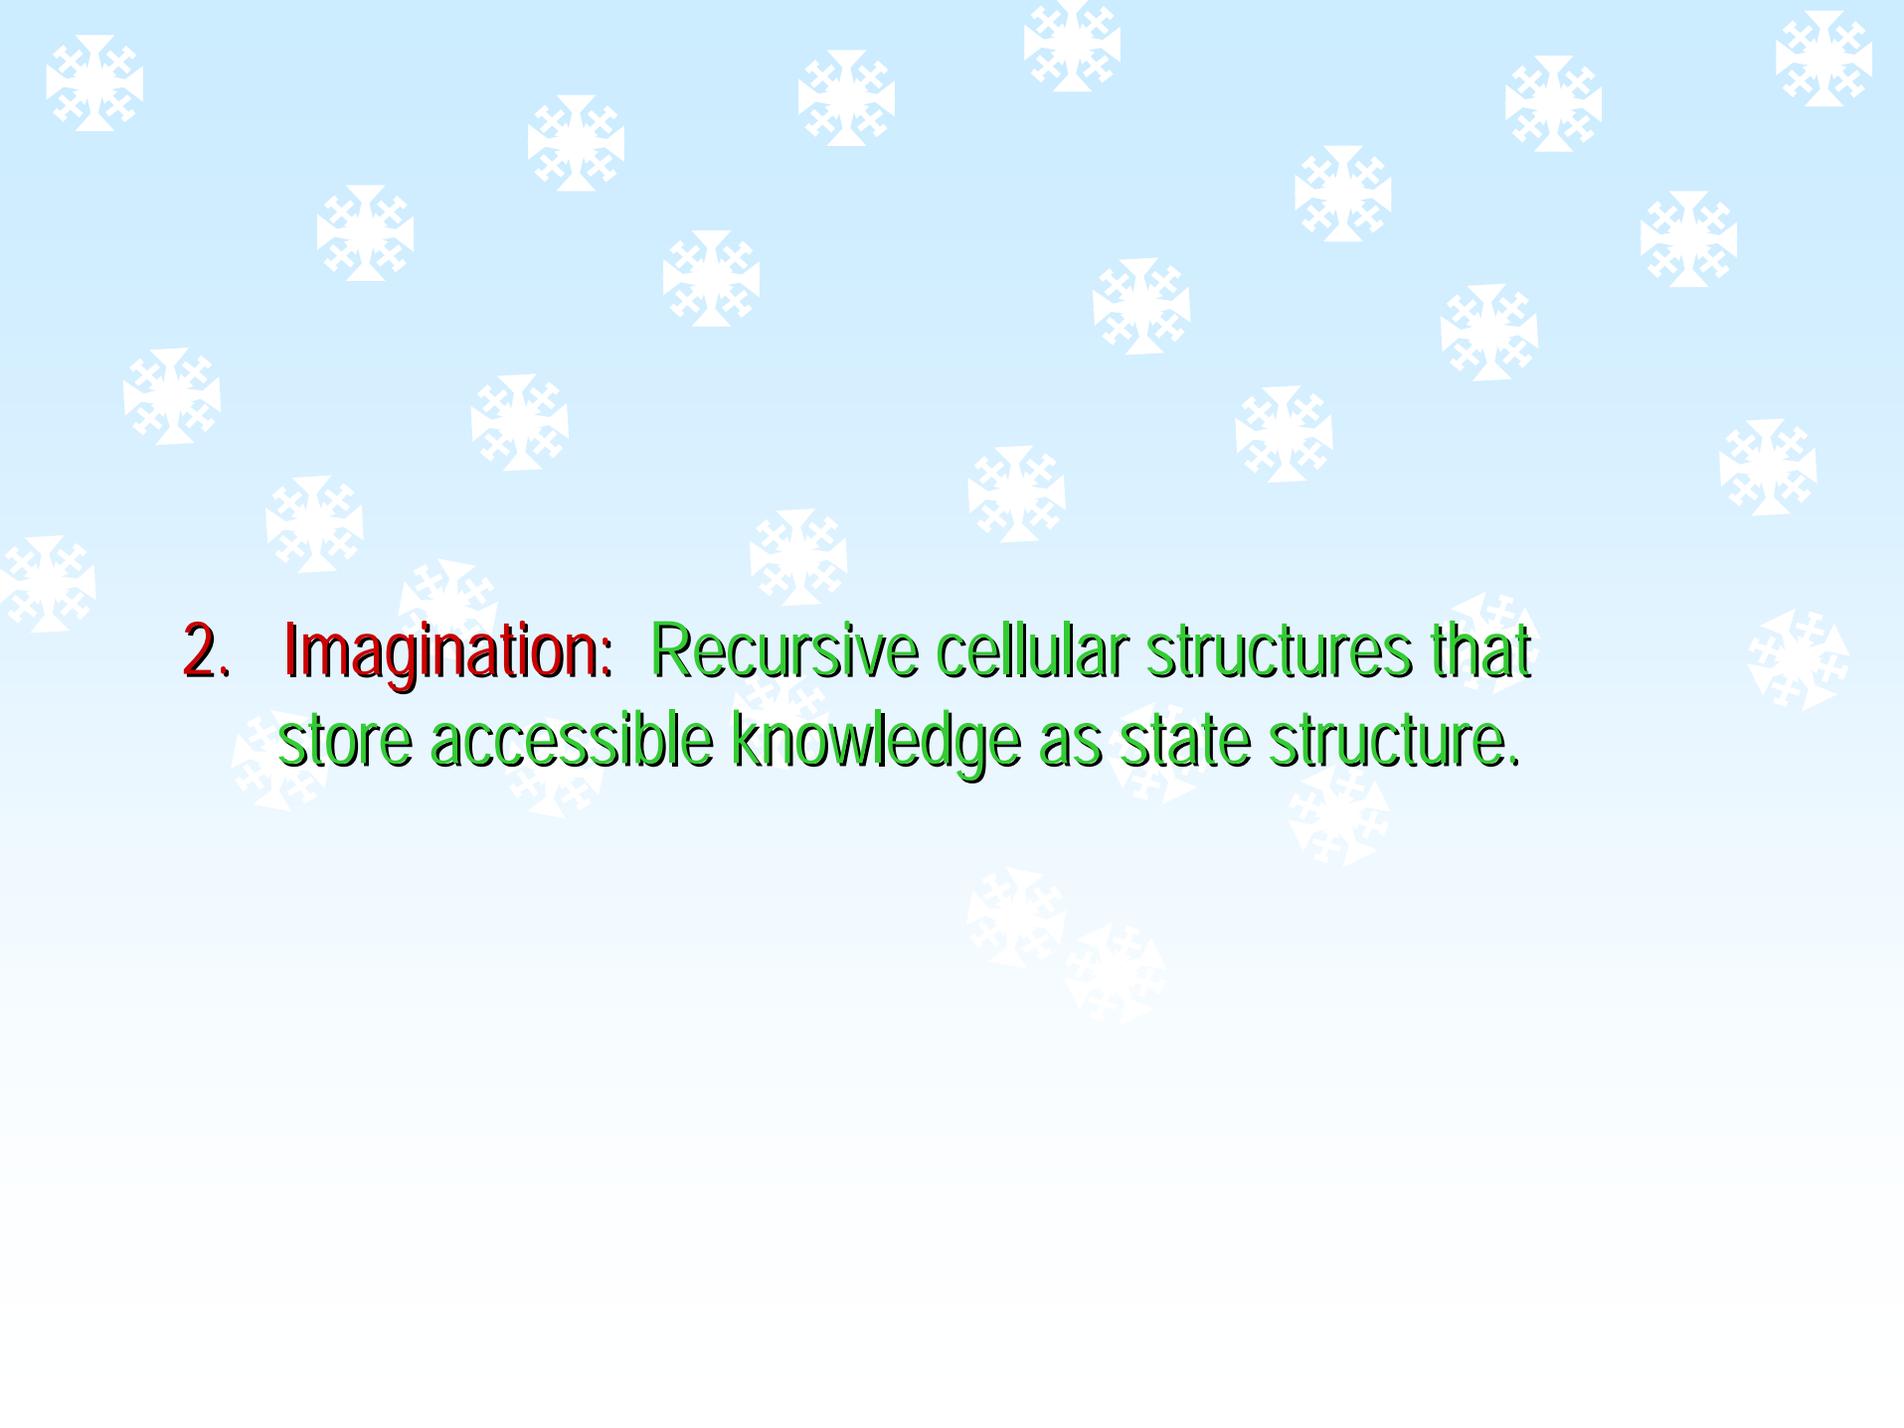

(2004): A 'kernel architecture' capable of supporting the five axioms:

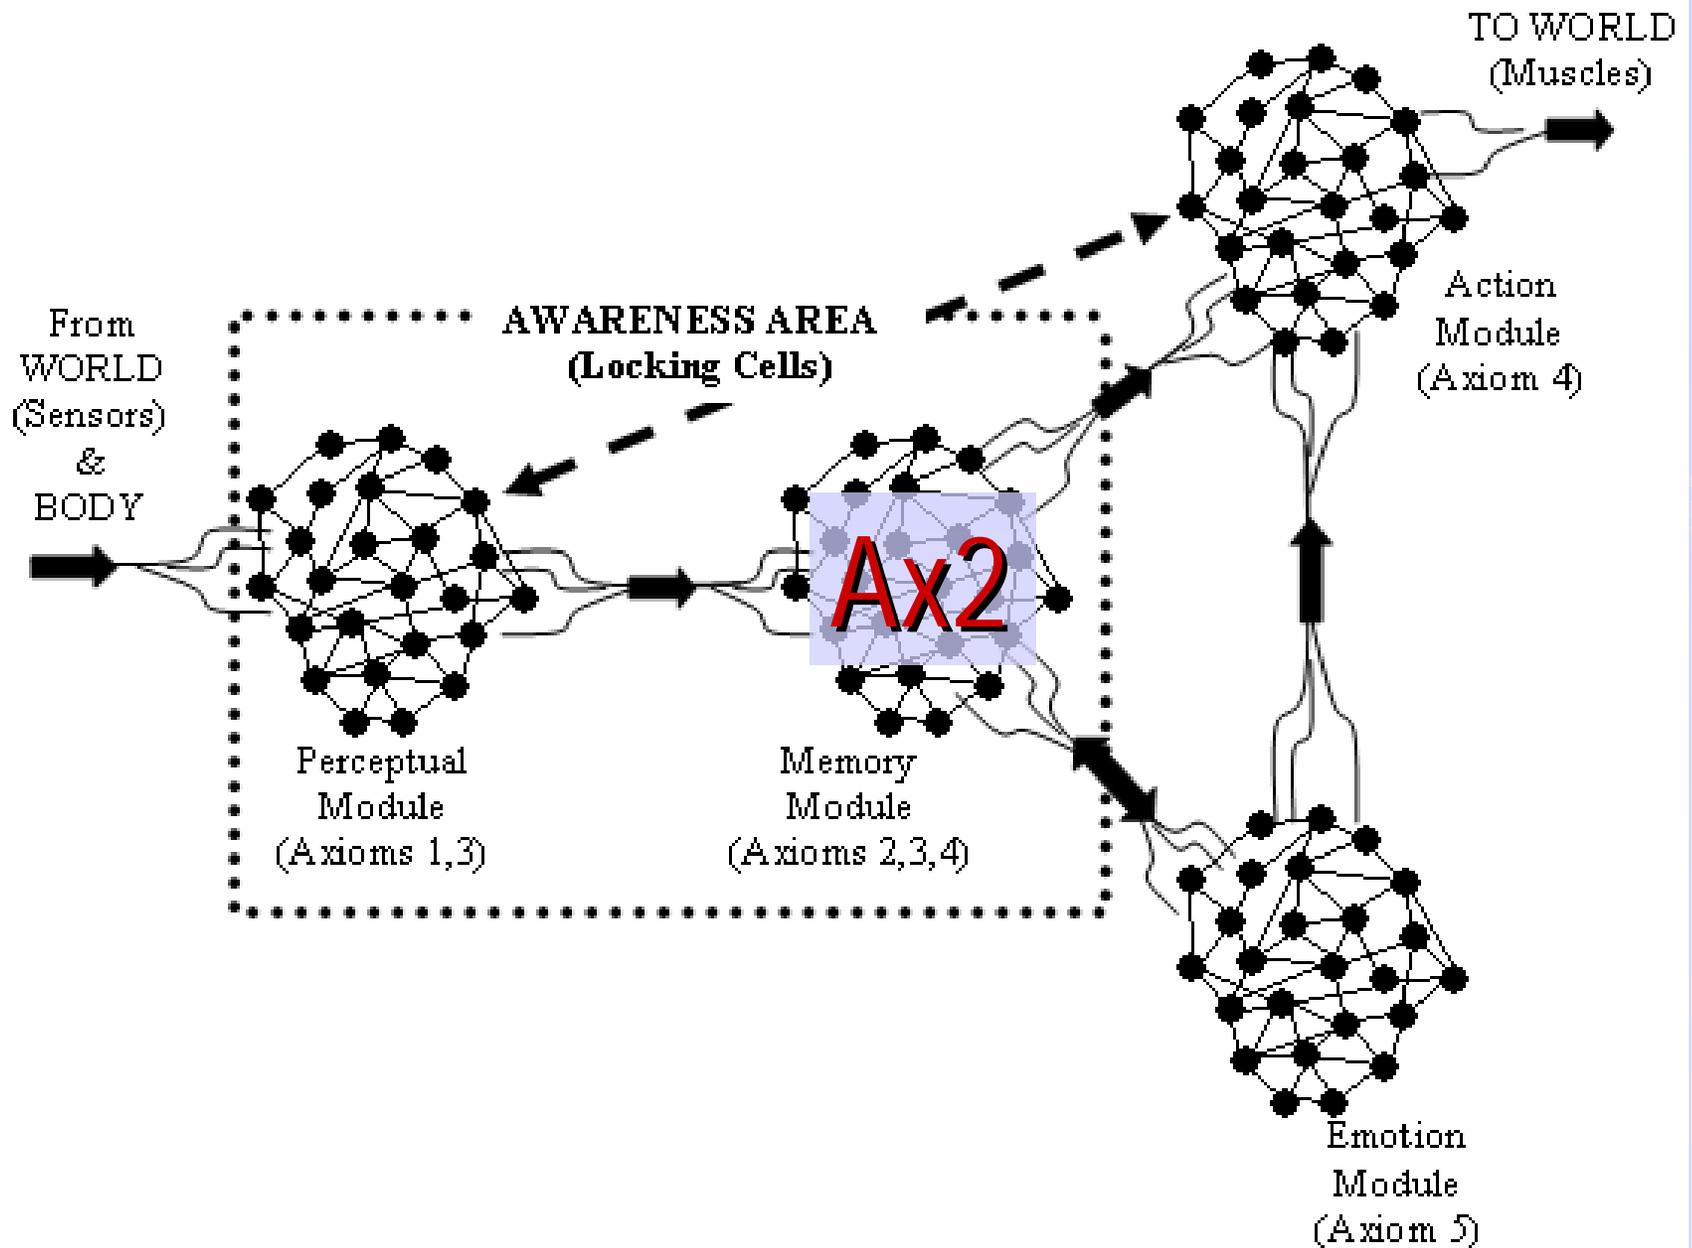

- 
1. **Presence: feeling a self in the 'out-there':** Accurate cellular depiction indexed on muscular data of (say) eye and head movement to capture the 'out there'.

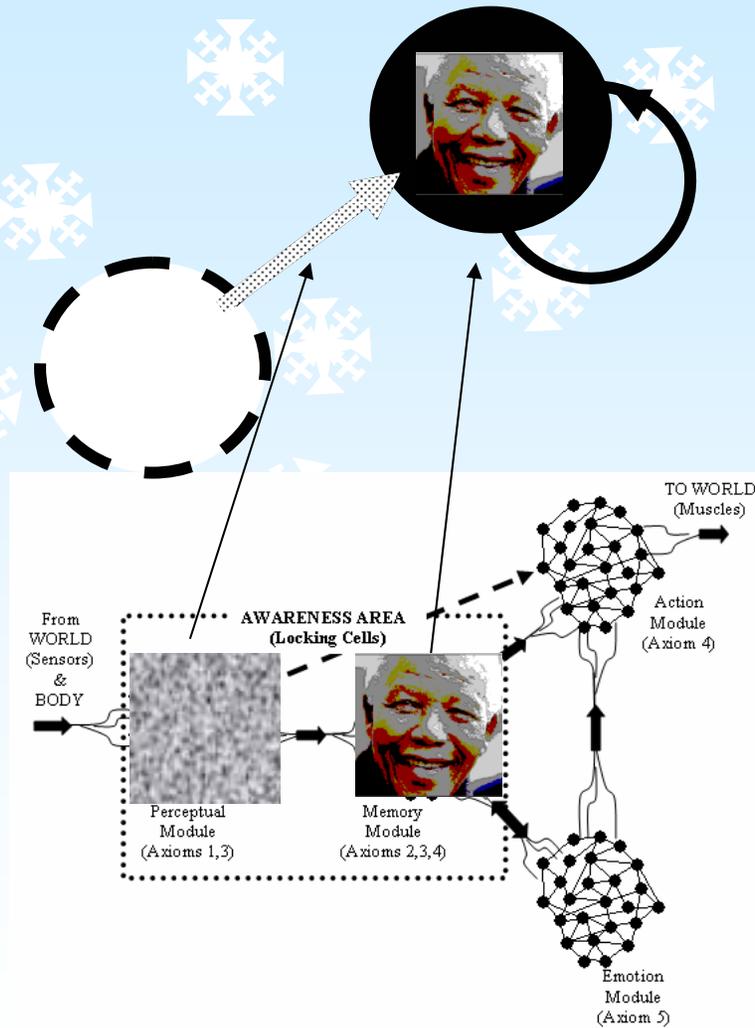

2. **Imagination:** Recursive cellular structures that store accessible knowledge as state structure.

(2004): A 'kernel architecture' capable of supporting the five axioms:

The build-up of experience in the imagination module

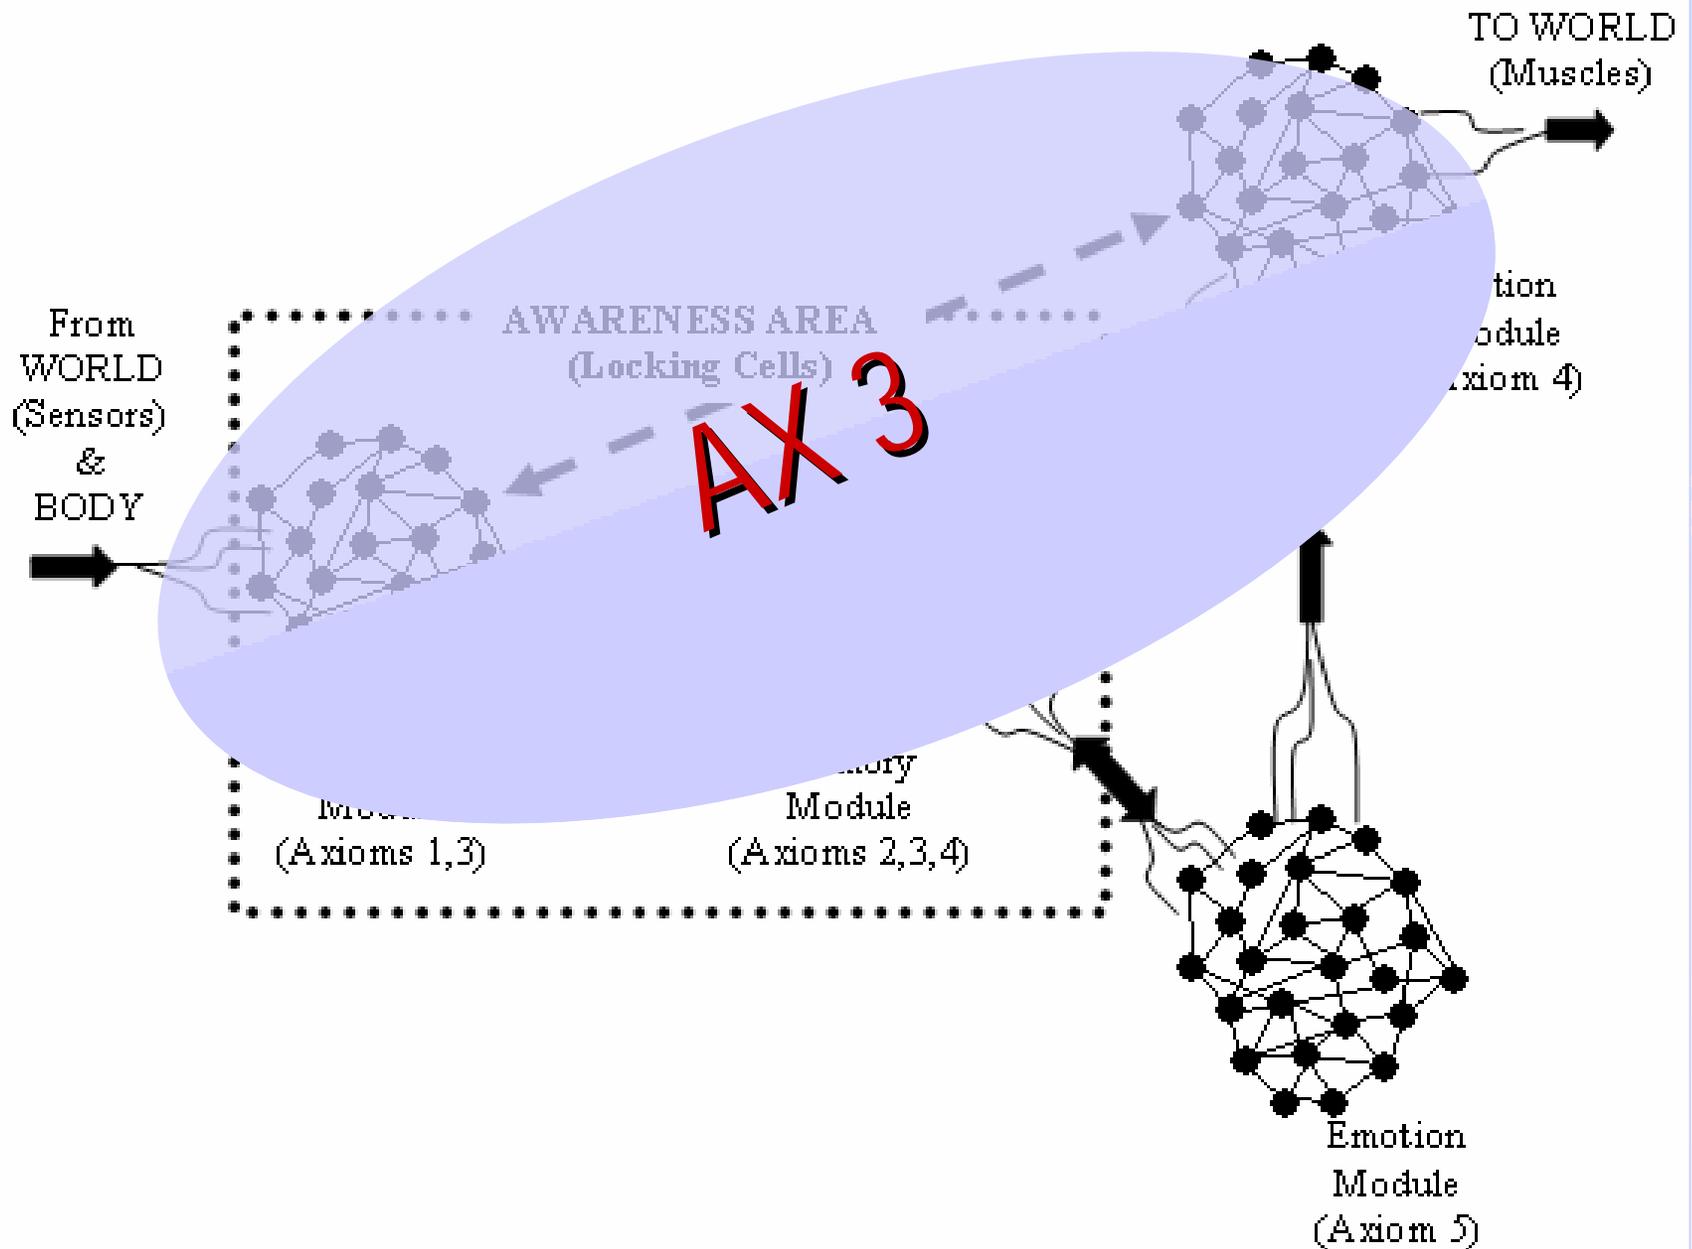

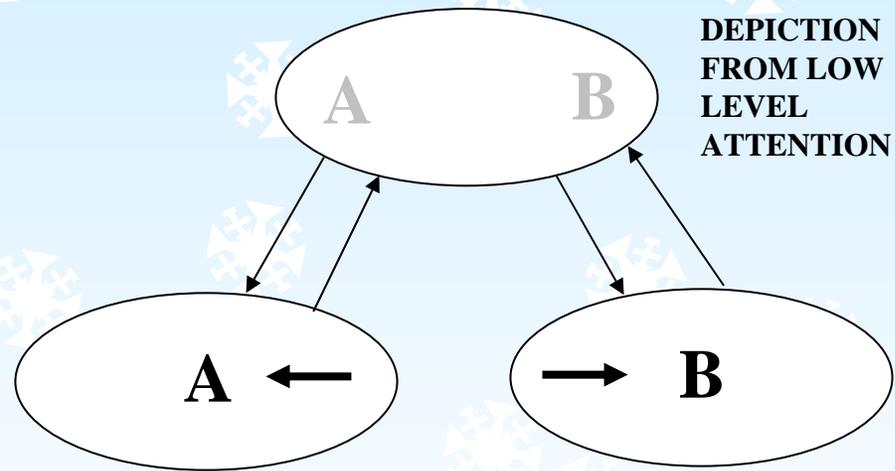

A Movie

3. **Attention:** Evolved muscle-driving mechanisms driven from sensory data *and* higher level (1 and 2) machinery optimised on accuracy of depiction.

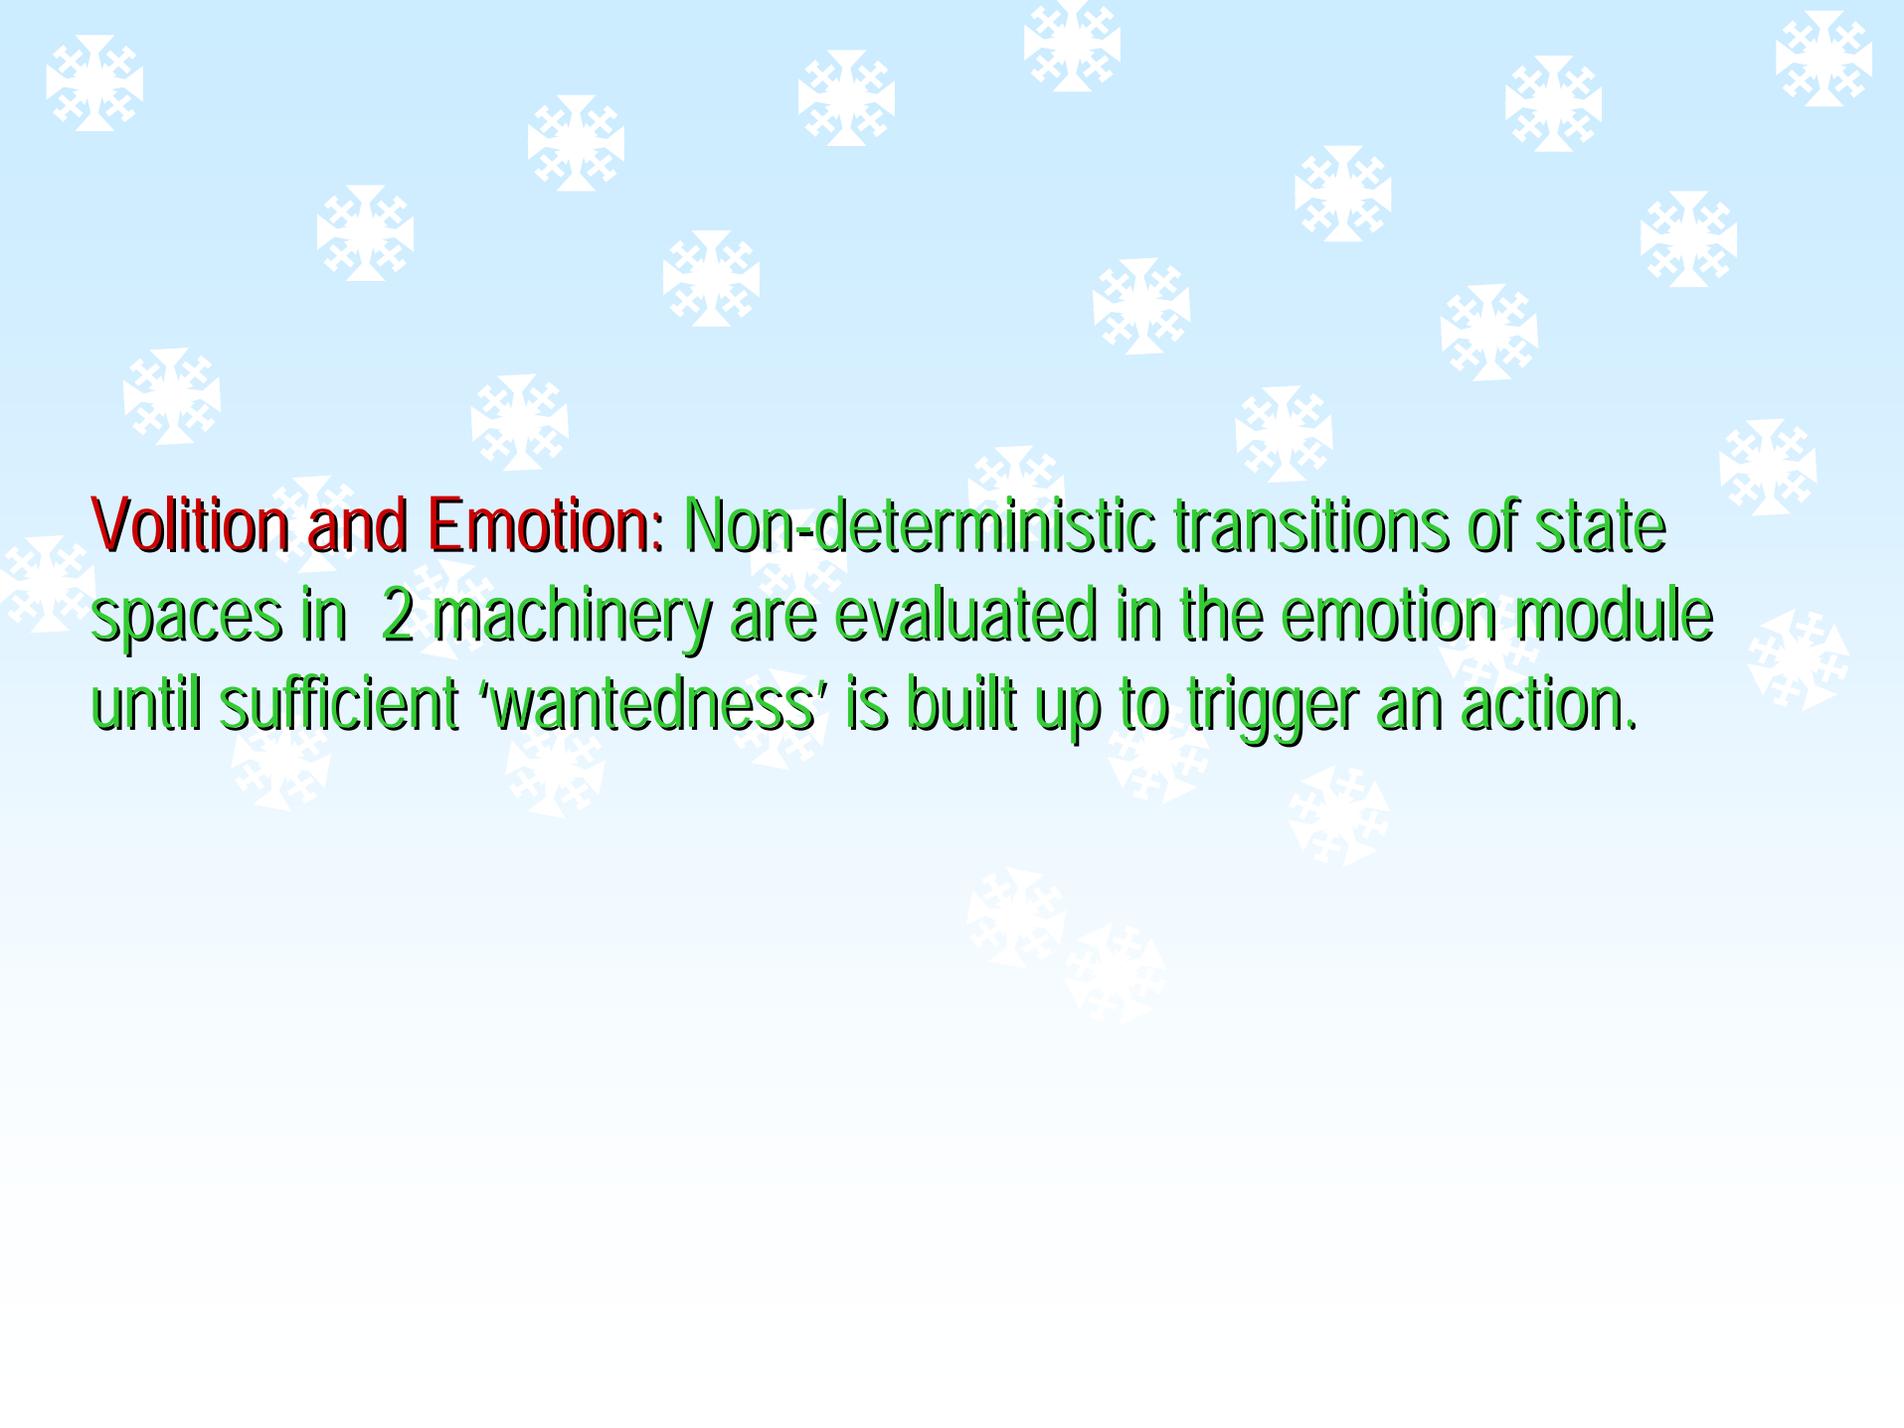

(2004): A 'kernel architecture' capable of supporting the five axioms:

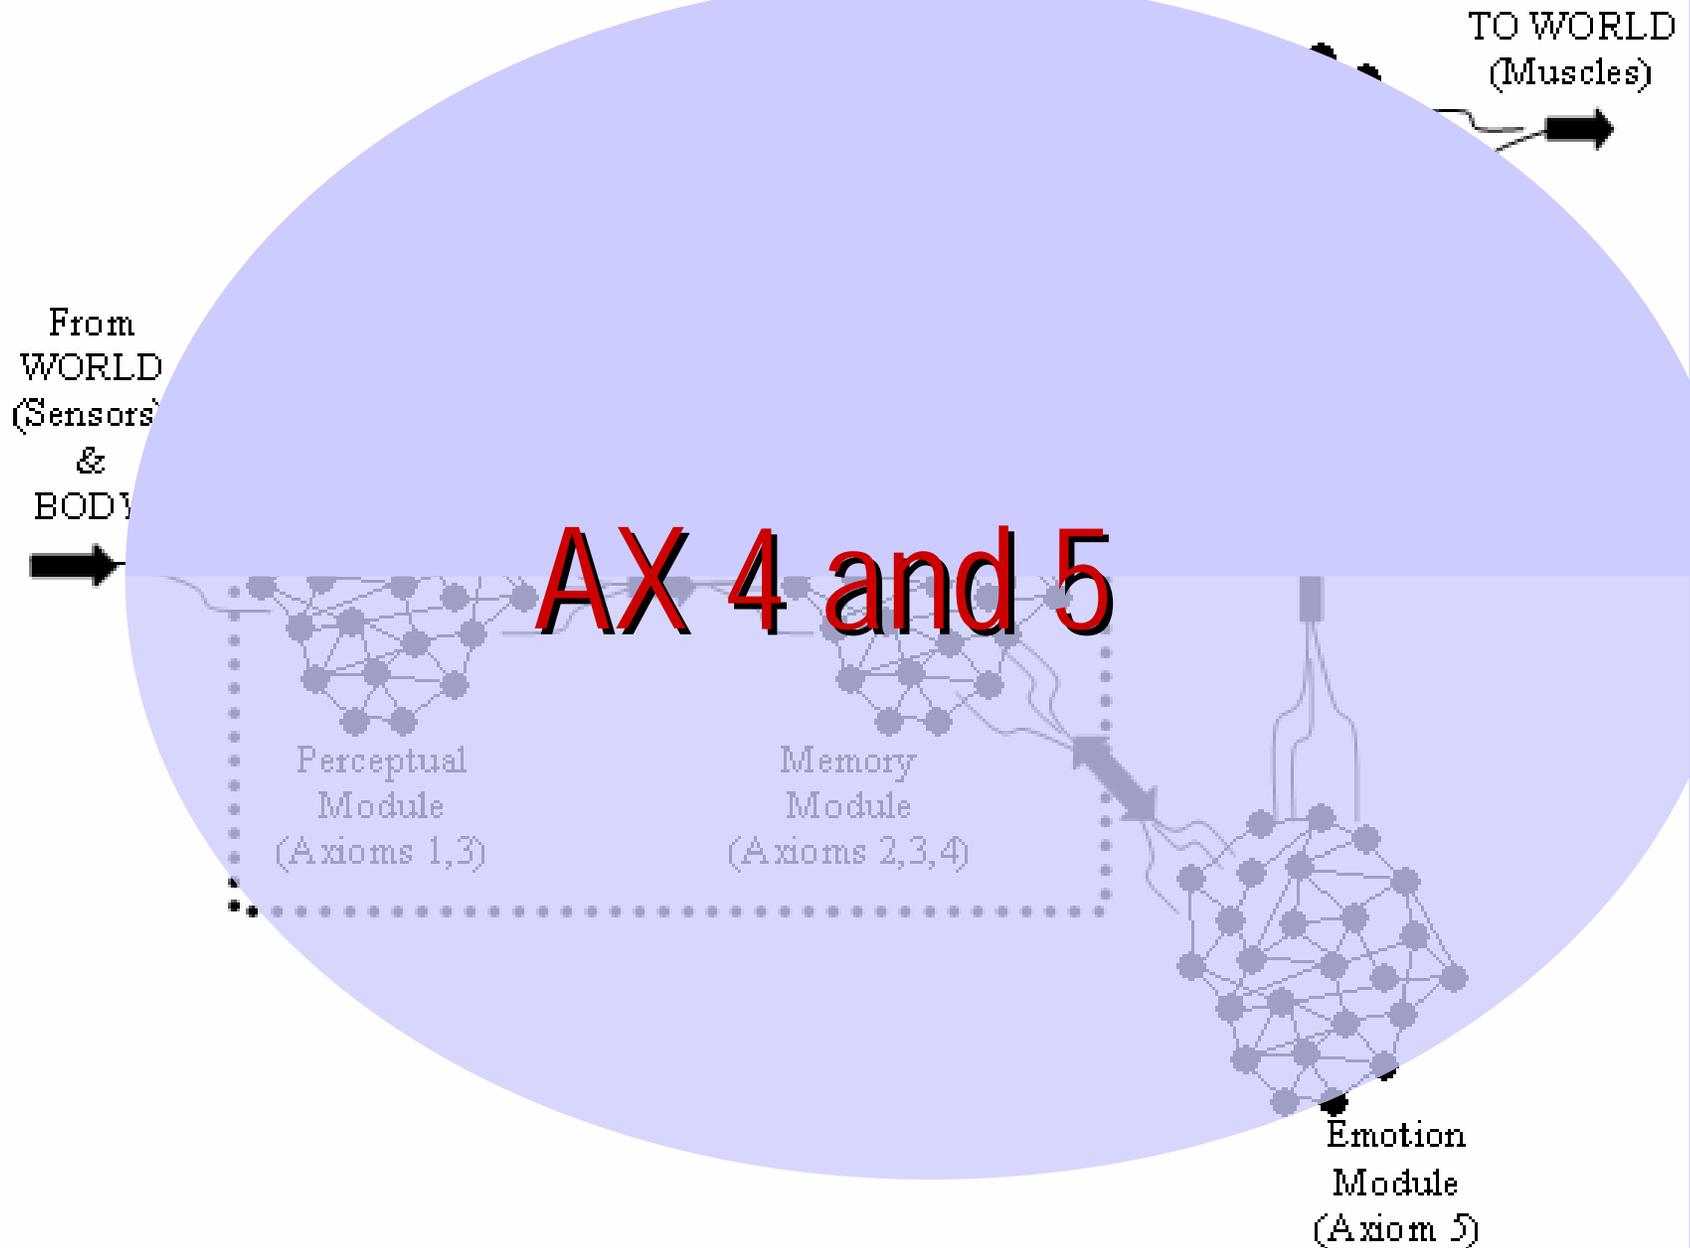

ATTENTIONAL STATES DUE TO (SAY) HEAD MOVEMENT

ALSO TRANSFERS ICONICALLY TO IMAGINATION MODULE

Volition and Emotion: Non-deterministic transitions of state spaces in 2 machinery are evaluated in the emotion module until sufficient 'wantedness' is built up to trigger an action.

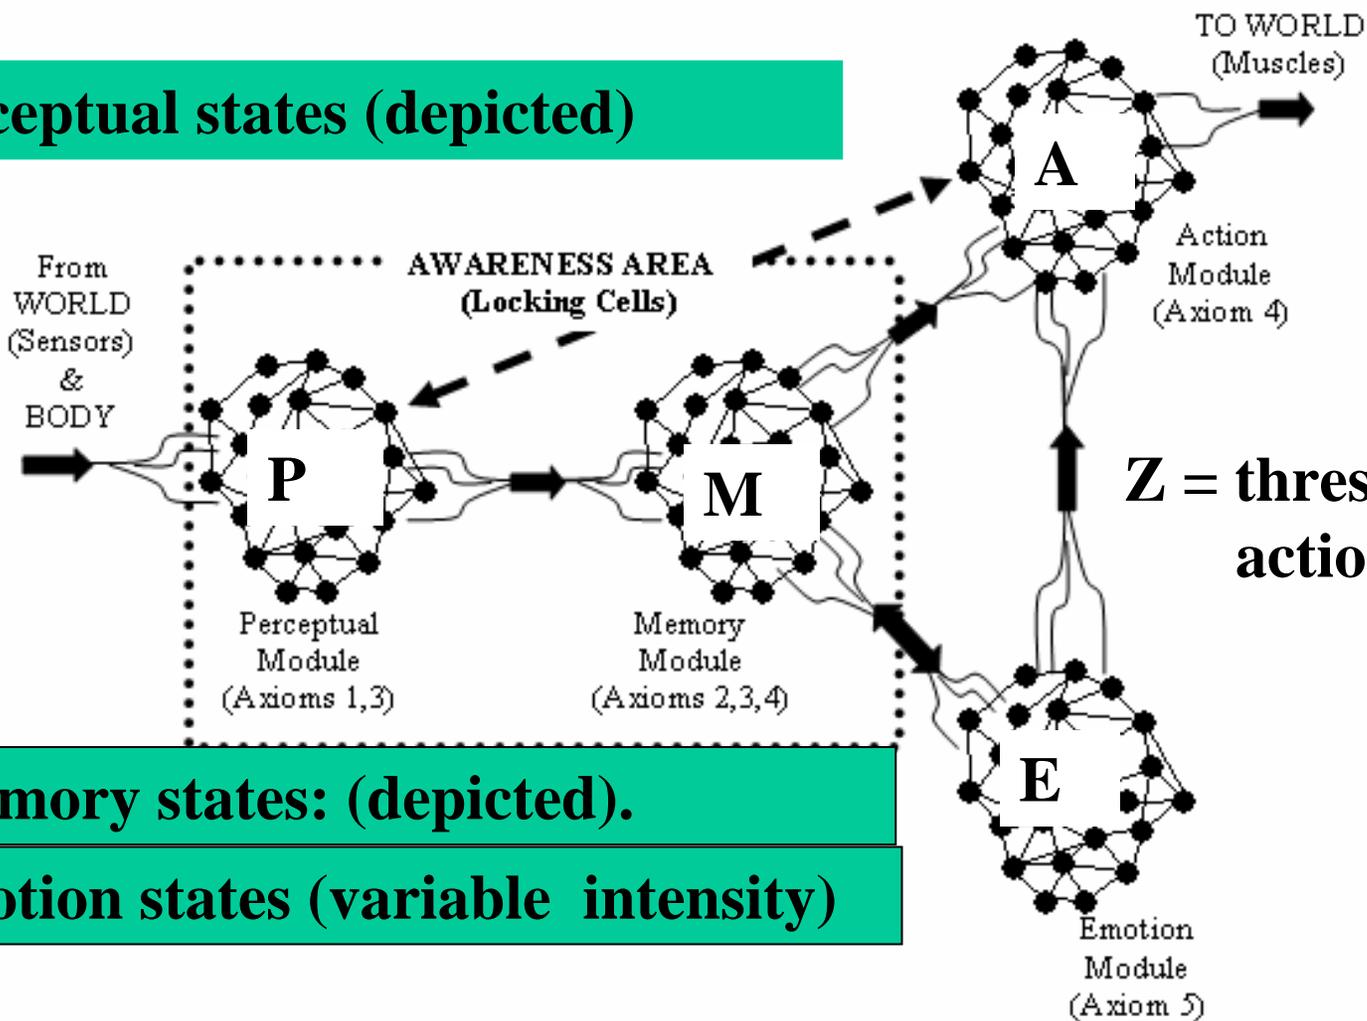

(2004): A 'kernel architecture' capable of supporting the five axioms:

THE 'KERNEL' ARCHITECTURE

An interplay of neural state machines.

P = Perceptual states (depicted)

M = Memory states: (depicted).

E = Emotion states (variable intensity)

A = Decided Action States (causing muscular activity)

THE PIZZA HOUSE

p1: looking at the menu

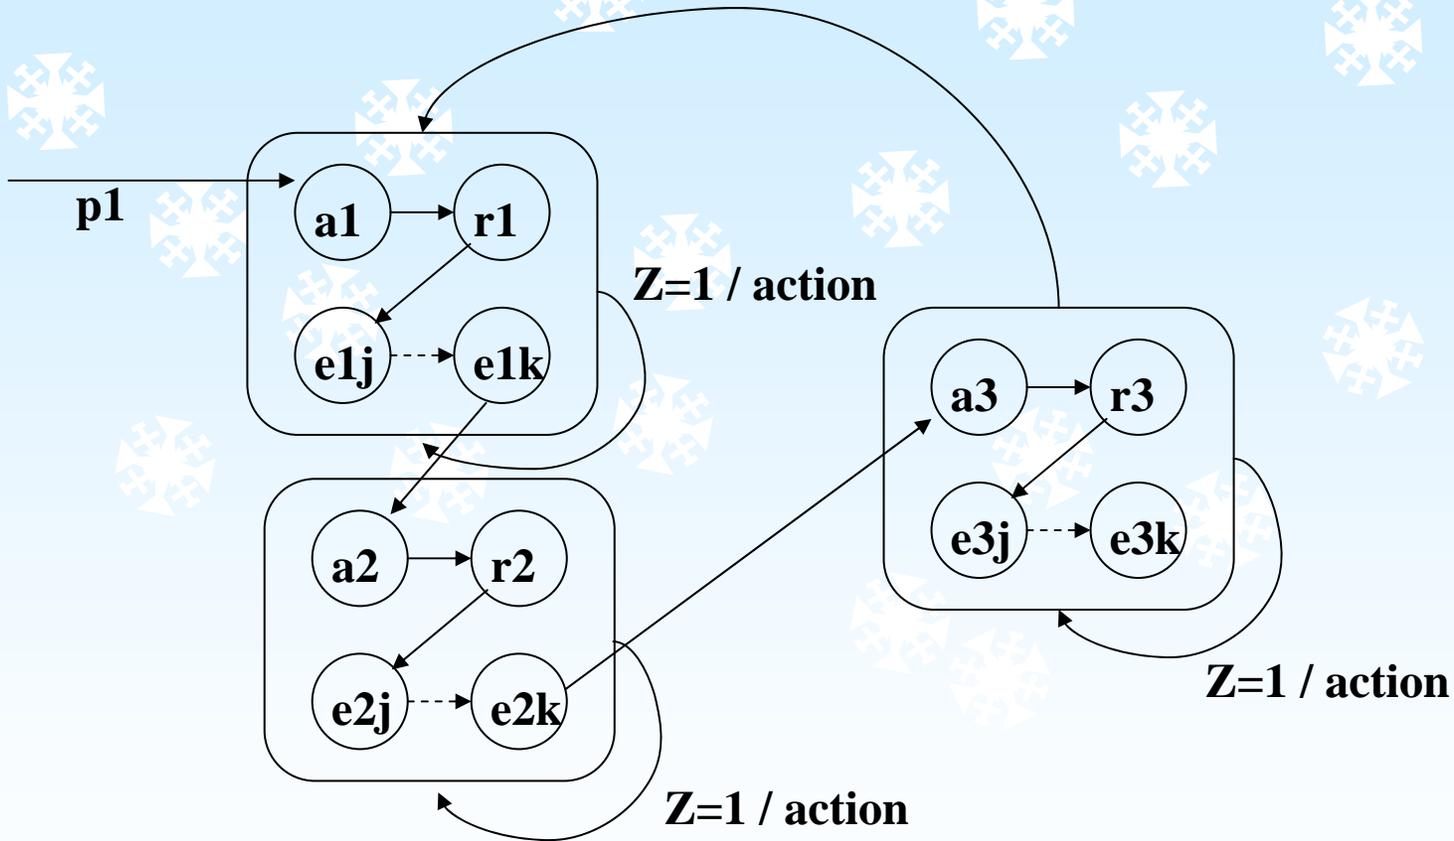

a1, a2, a3: recognise choices pizza, pasta or salad.

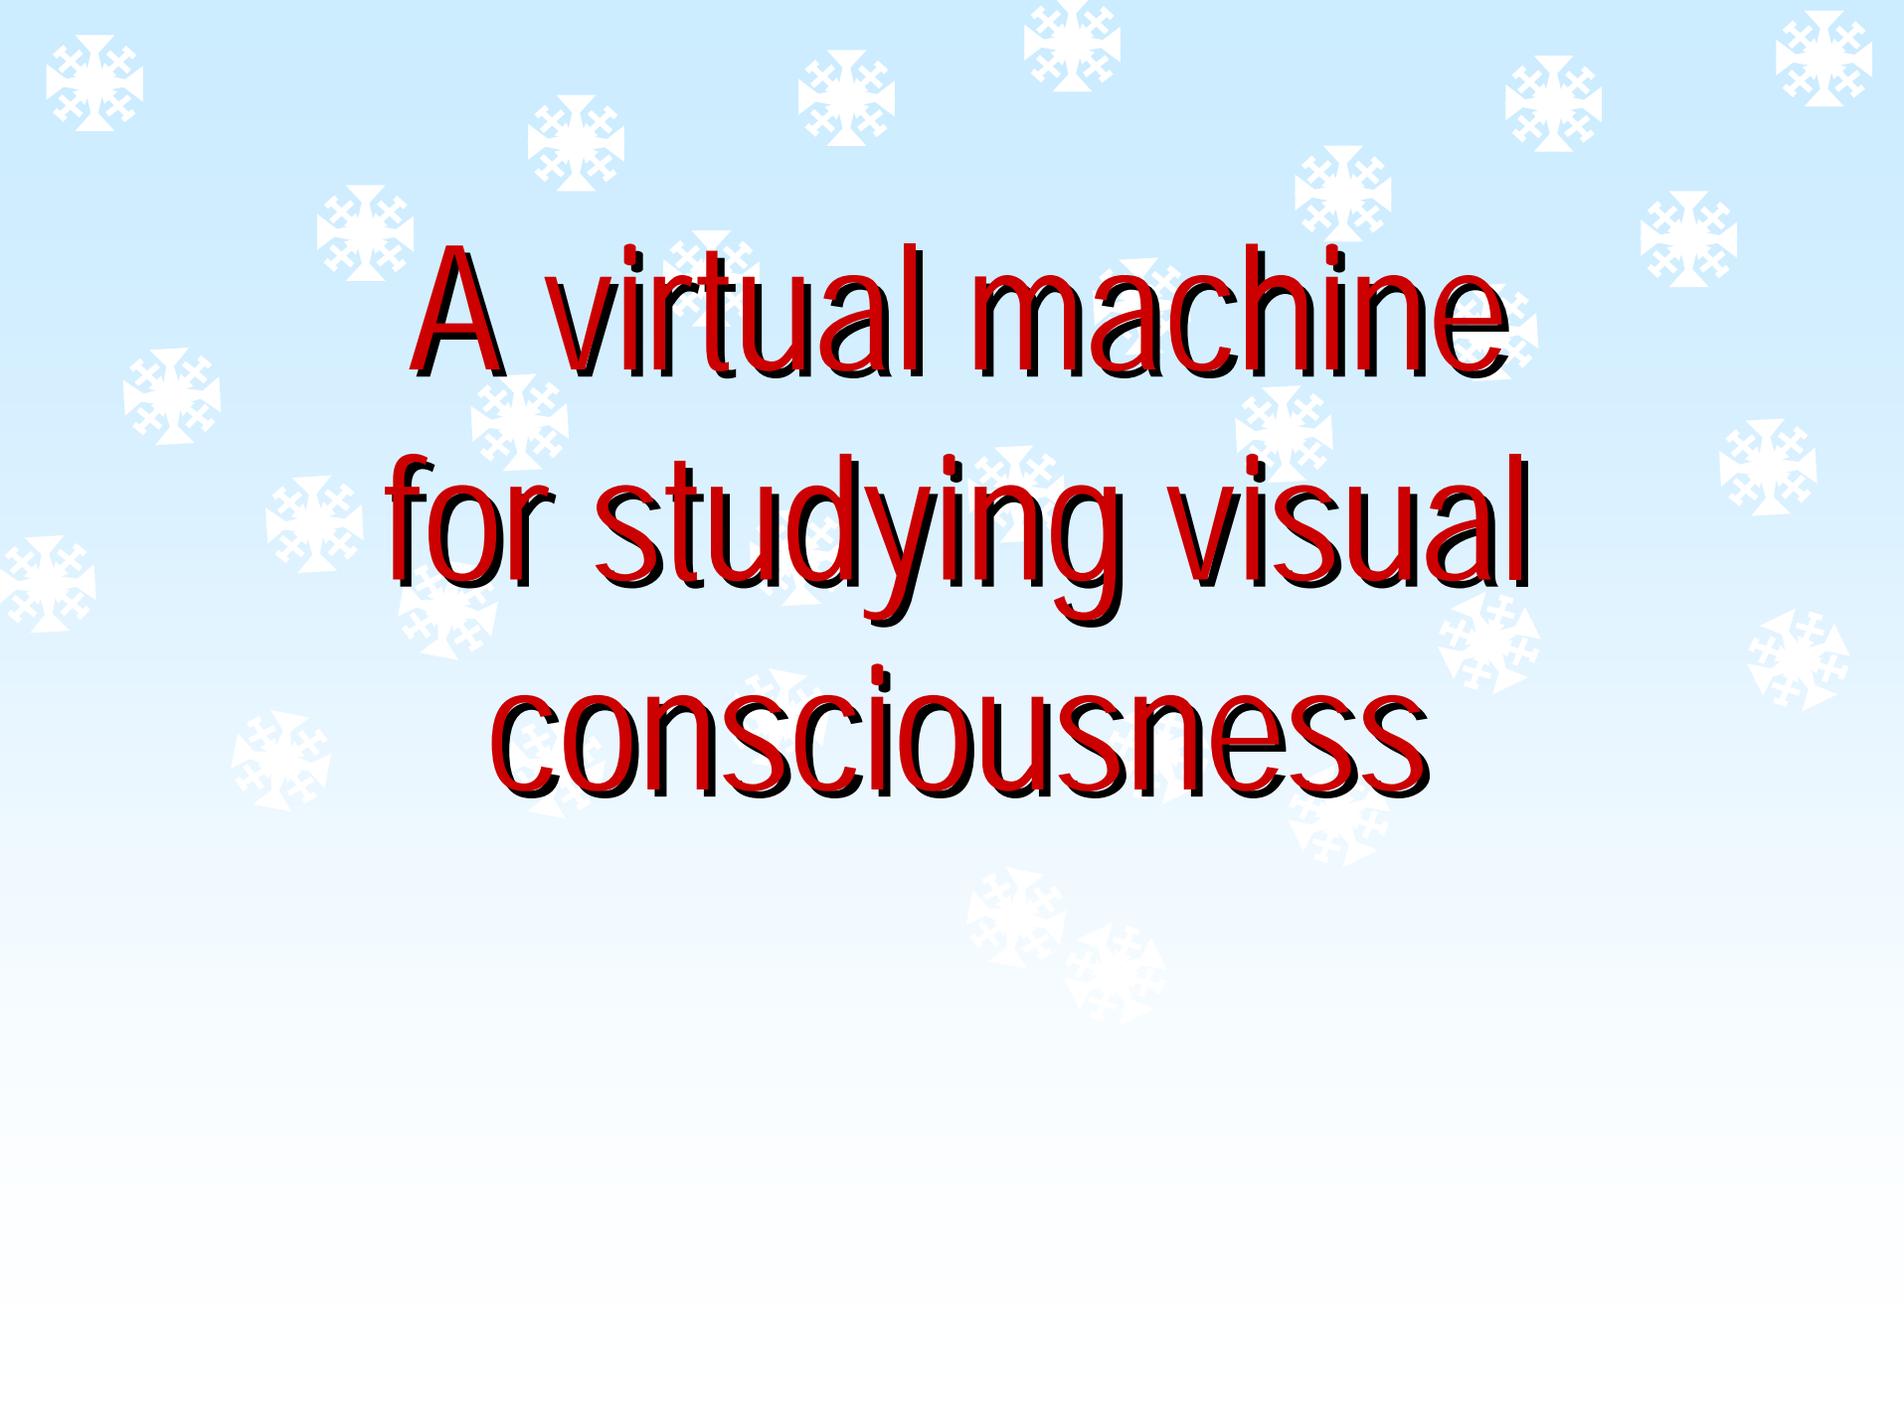

r1, r2, r2: memory of properties of each dish

e1, e2, e3: memory of pleasure, guilt, satiation for each rx.

W = e1(i) + e2(i) + e3(i) + rand, evaluation of intensity for each r towards generating **Z**

THE STATE STRUCTURE OF THINKING AND WANTING

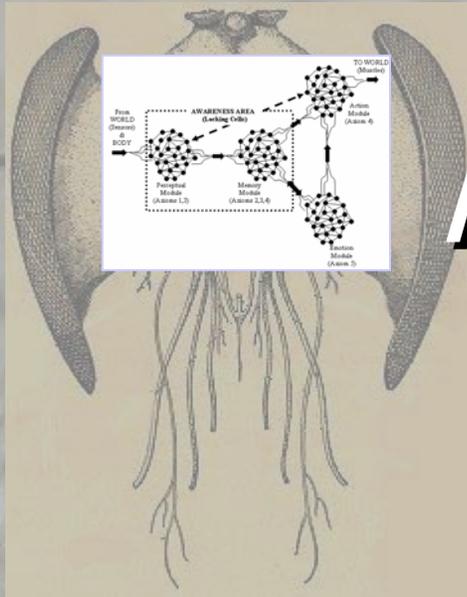

**A virtual machine
for studying visual
consciousness**

A close-up photograph of a honeybee on a wooden surface. The bee is positioned diagonally, facing towards the left. Its body is covered in fine hairs, and its wings are partially visible. The background is a blurred wooden texture. Overlaid on the right side of the image is the text "ARE BEES CONSCIOUS?" in a large, white, sans-serif font with a black outline.

ARE BEES
CONSCIOUS?

YES THEY HAVE A
DEPICTIVE
ARCHITECTURE IN
THEIR BRAINS

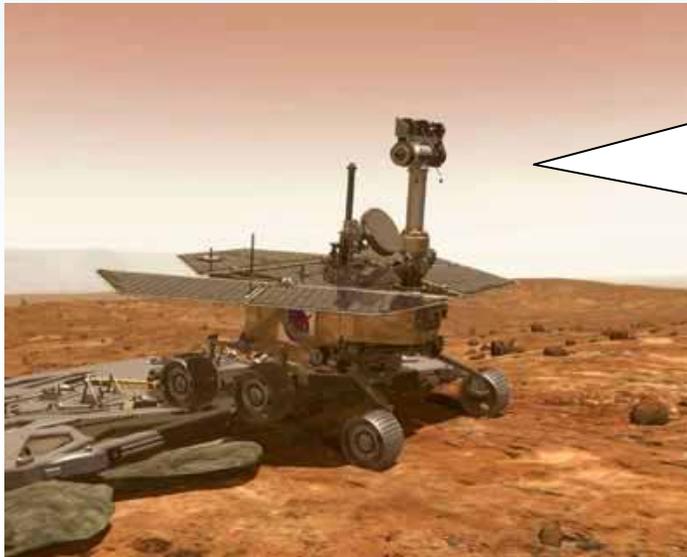

Can the constructive approach help answer important questions?

What is the difference between conscious people, animals and machines?

CONTENT: What the organism DOES with its depictive architecture!

COGITO

Is the terrain safe
for me?
Are my batteries
fully charged?

CONTENT: What the organism DOES with its depictive architecture!

COGITO

In other words:
Mechanisms for consciousness are
similar

but
MINDS
are very different

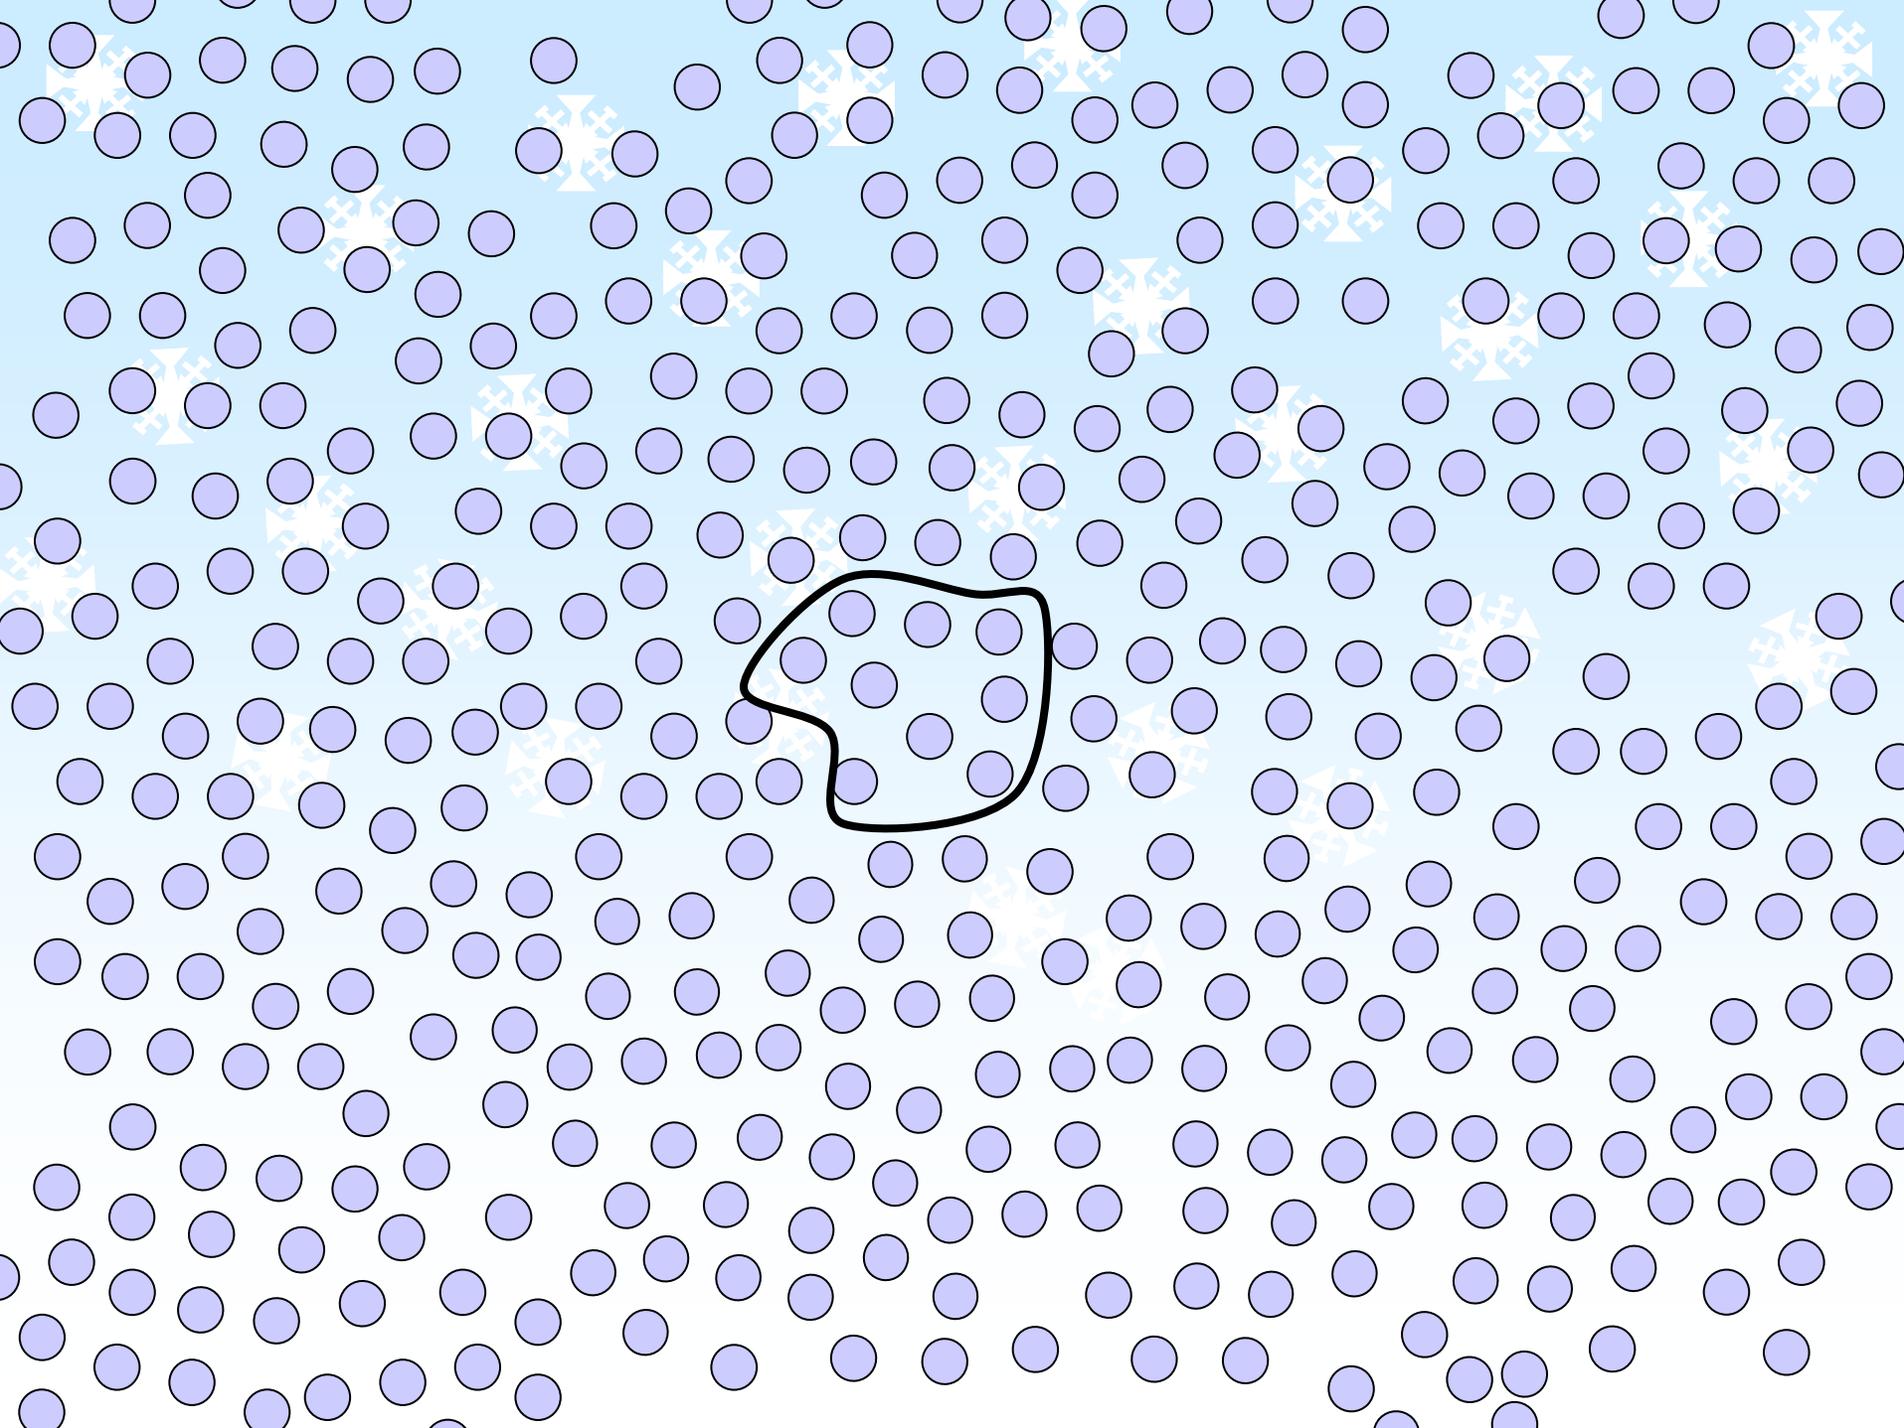

safe

eries
d?

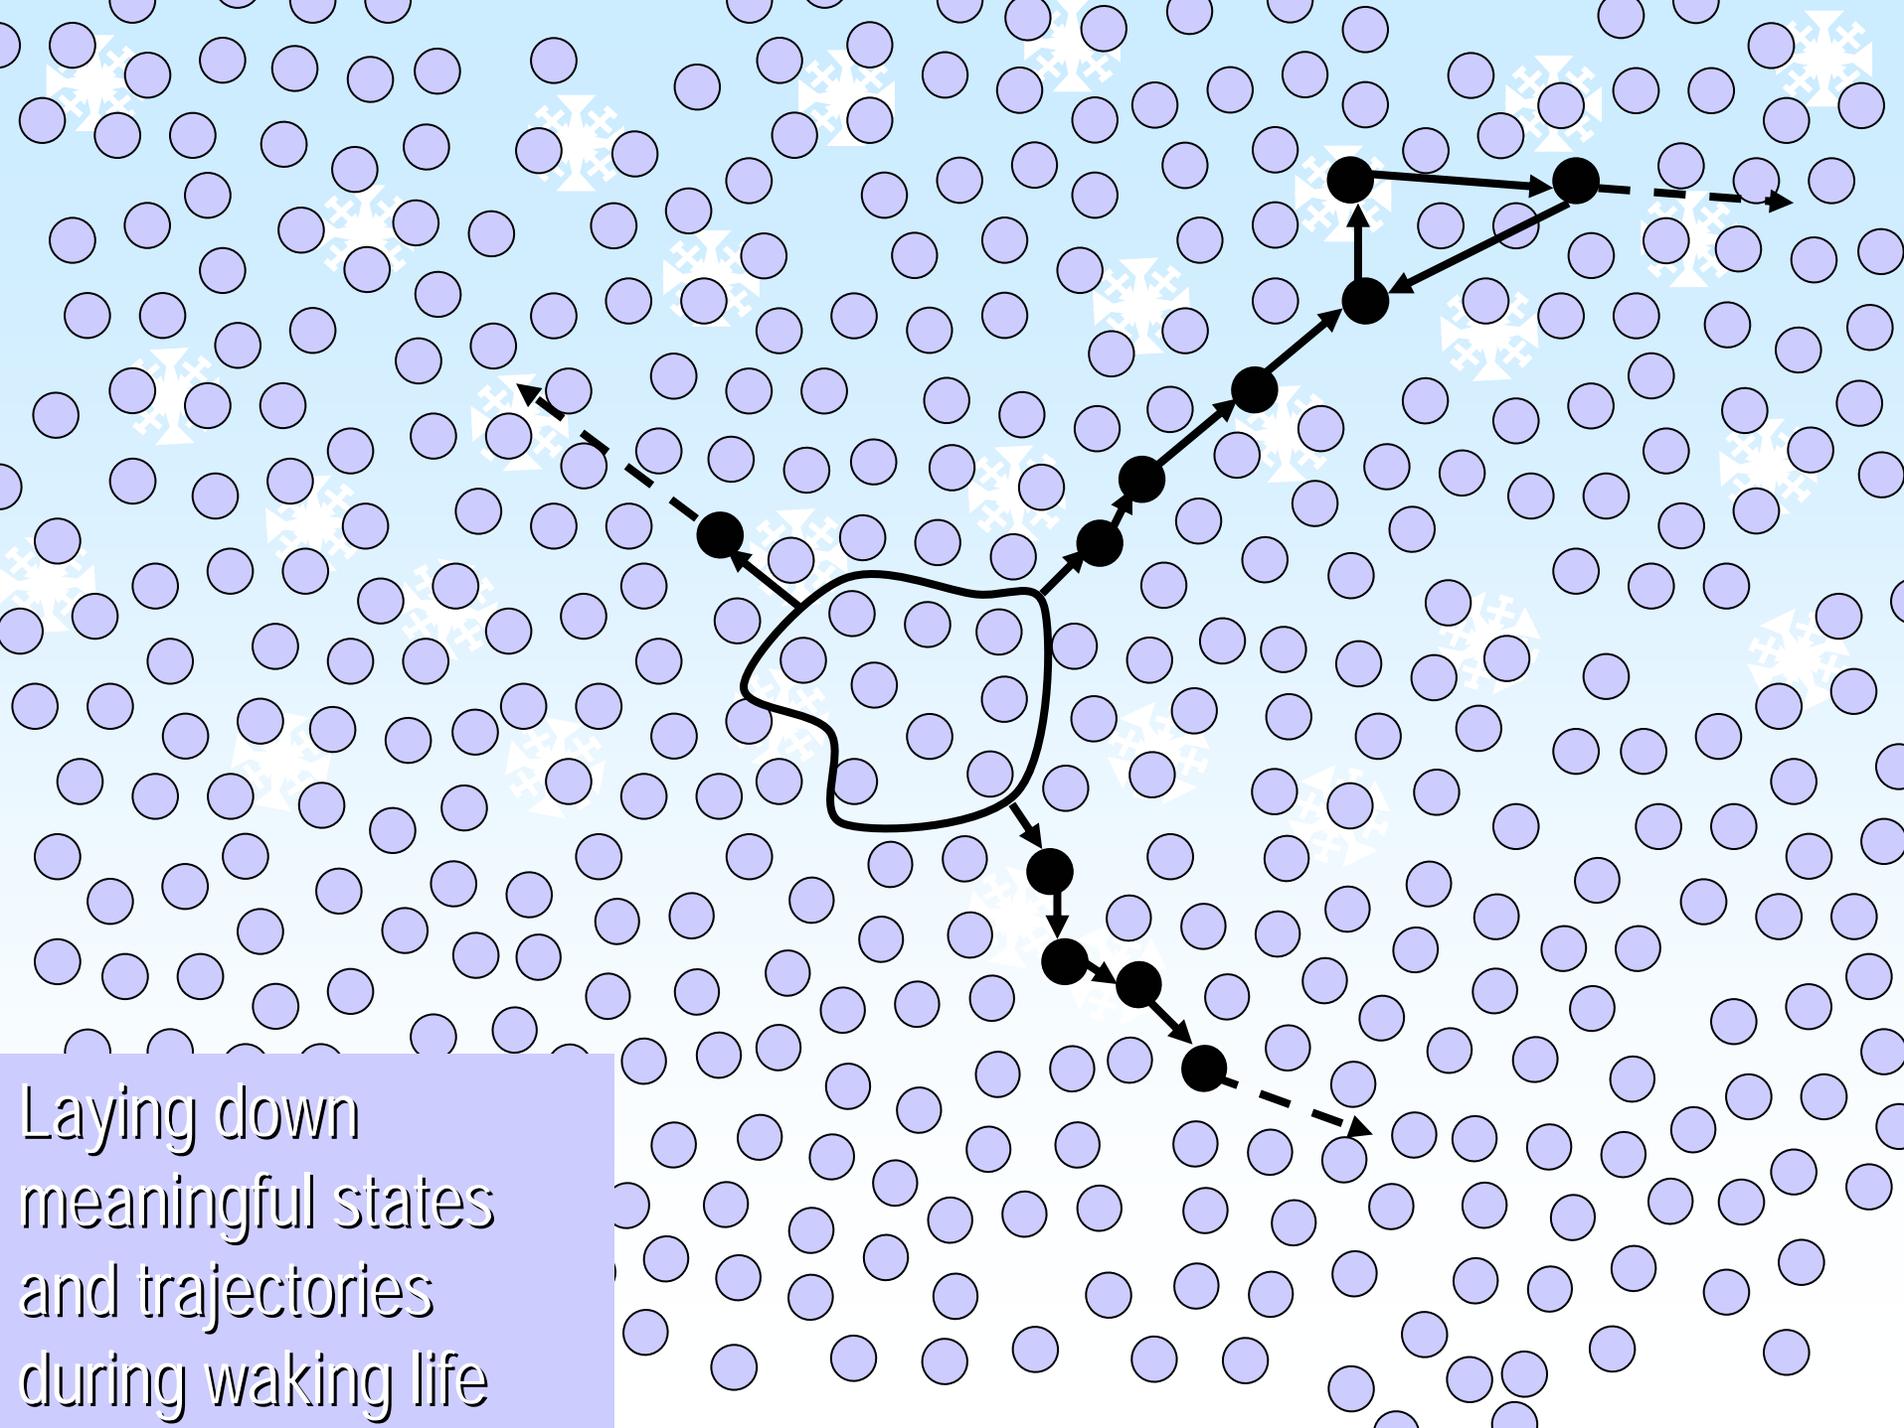

Can the constructive approach help answer important questions?

What are dreams?

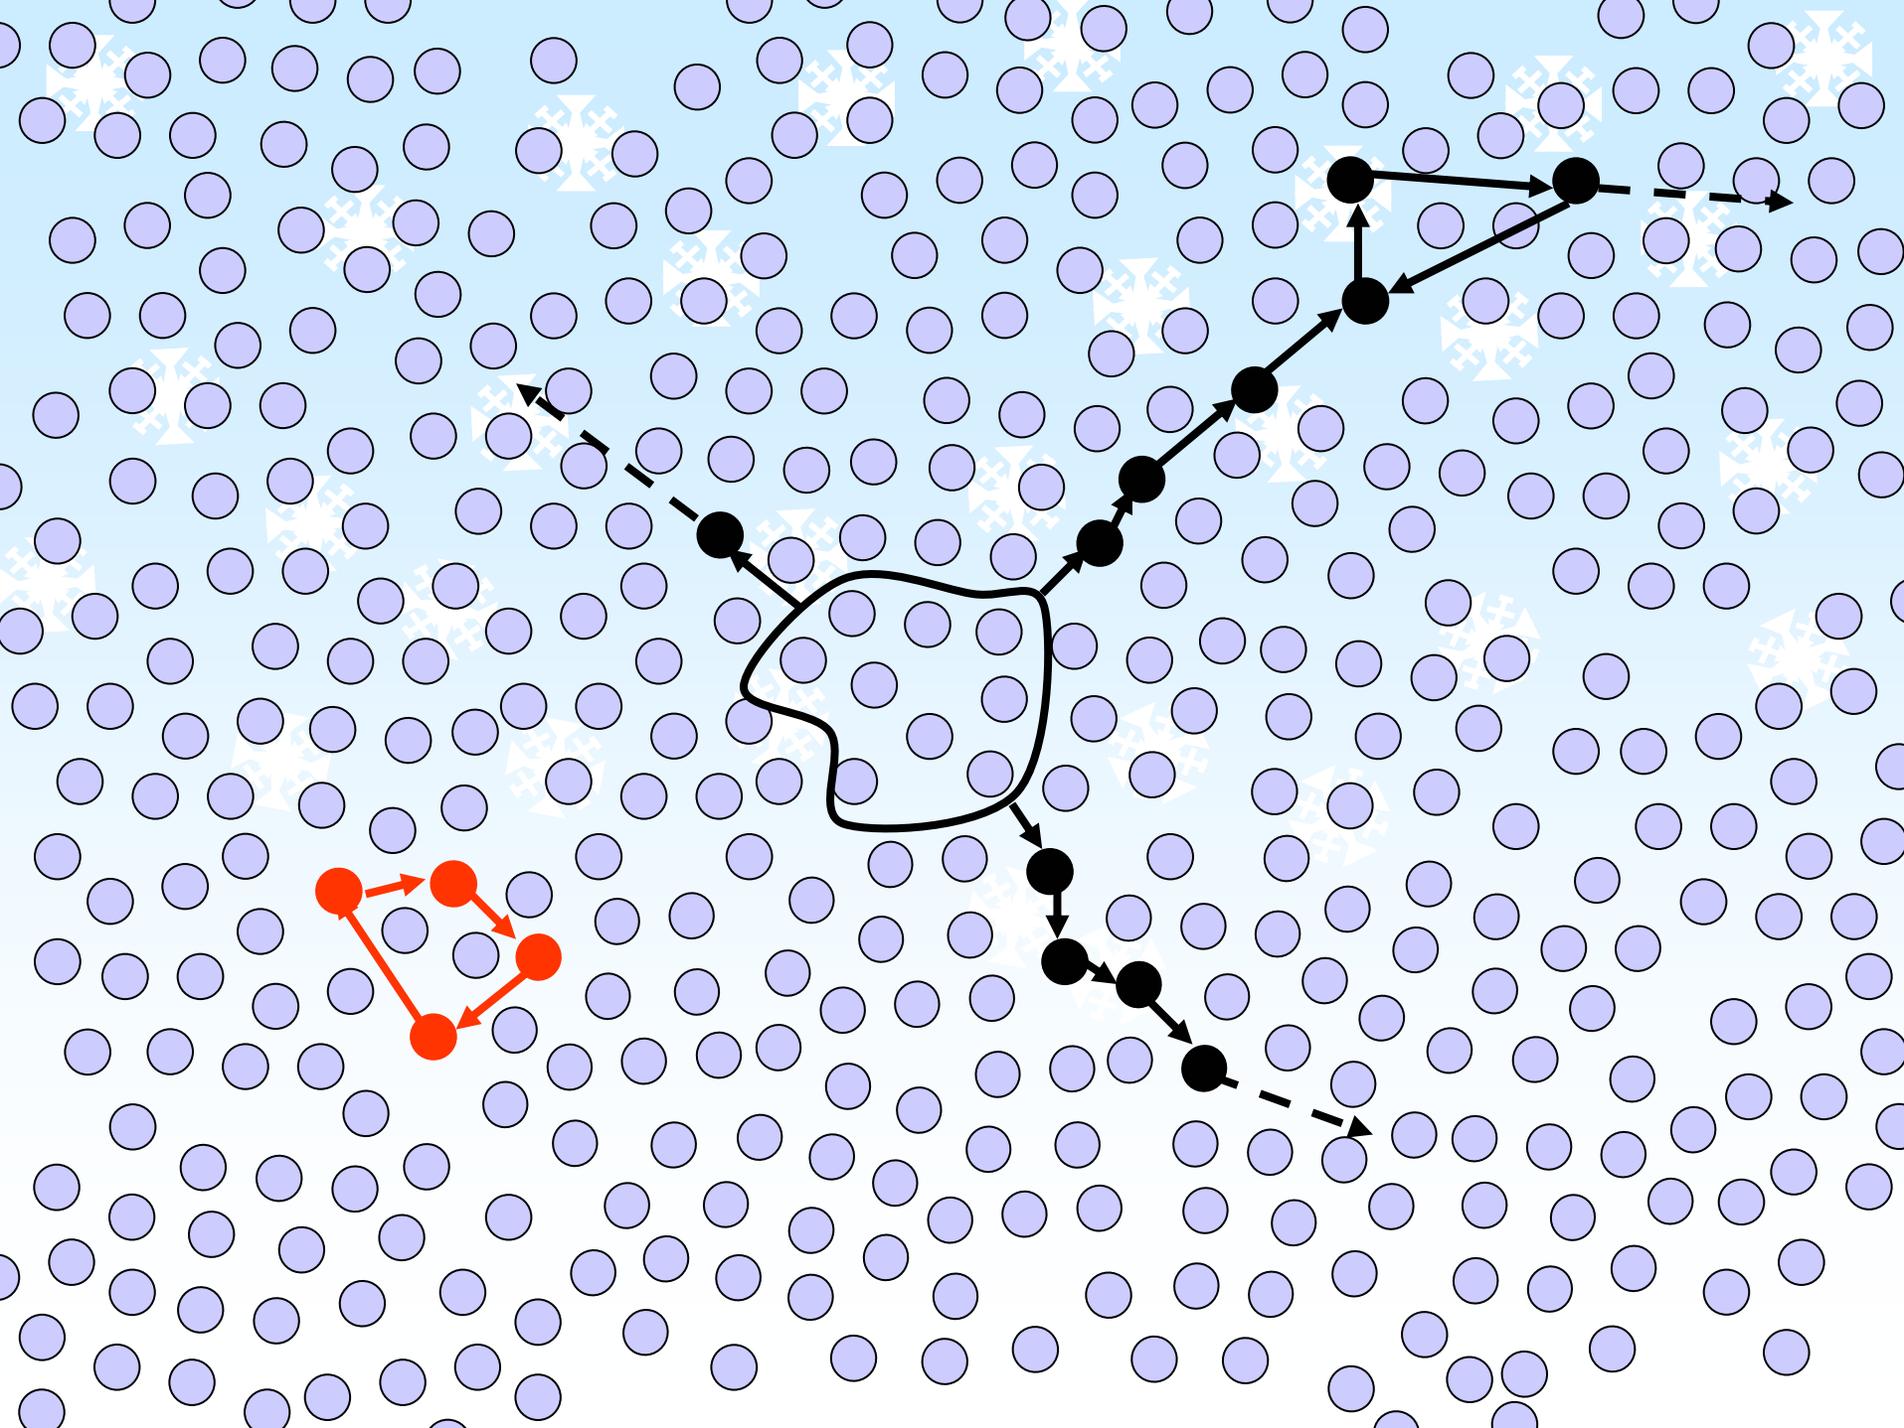

Laying down
meaningful states
and trajectories
during waking life

Can the constructive approach help answer important questions?

What is 'the unconscious'?

Can the constructive approach help answer important questions?

What is meant by free will?

What is the Soul?

Can we understand mental deficits better?

To Finish

We have learned that consciousness can be studied on machines to understand it better.

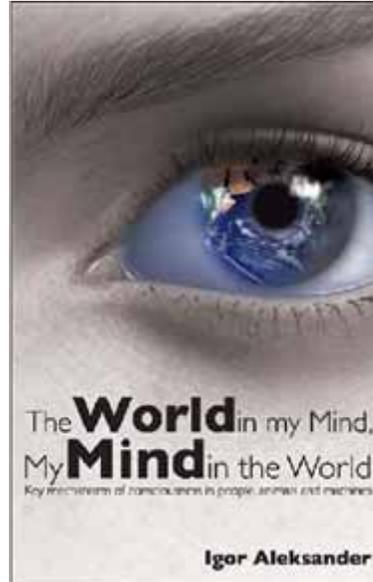

This is useful in suggesting what our brains do to make us enjoy Christmas.

Have a Happy one!!!

Feel free to ask: i.aleksander@imperial.ac.uk
